Directions were given by Mayor Edson that, as soon as practicable before Feb. 1, 1884, the service in the several departments shall be organized by the systematic classification by grades of the positions in each department, so that positions of the same responsibility, and requiring the same degrees of capacity, within certain limits, shall be placed at the same rate of compensation; "and the relative rates of compensation for the several grades of position shall be proportioned as near as may be to the relative responsibility and character of the duties properly devolved upon such positions, provided that in such adjustment a proper allowance may be made for previous length of service. Such classification will be considered in no sense as promoting or degrading the persons occupying such positions as may be increased or reduced in compensation, but as reorganization of the service with reference to the absolute importance of the duties in each position and its relation in such regard to other positions."

REVENUE AND TARIFF. See Congress, p. 193.

RHODE ISLAND. State Government.—The following were the State officers during the year: Governor, Alfred H. Littlefield, succeeded, May 29th, by Augustus O. Bourn, Republicans; Lieutenant-Governor, Henry H. Fay, succeed-

ed by Oscar J. Rathbun; Secretary of State, Joshua M. Addeman; General Treasurer, Samuel Clark; State Auditor and Insurance Commissioner, Samuel H. Cross; Railroad Commissioner, Henry Staples; Attorney-General, Samuel P. Colt; Adjutant-General, Elisha Dyer, Jr.; Commissioner of Public Schools, T. B. Stockwell. Judiciary, Supreme Court: Chief-Justice, Thomas Durfee; Associate Justices, Pardon E. Tillinghast, Charles Matteson, John H. Stiness, and George M. Carpenter, Jr.

Legislative Sessions.—The Legislature of 1882-'83, consisting of 80 Republicans and 6 Democrats in the Senate and 68 Republicans and 9 Democrats in the House, convened in Providence for its second session on the 30th of January and adjourned on the 18th of April. Among the bills passed were the following:

Amendments to the act for the suppression of intemperance; in relation to truant children, and of the attendance of children in the public schools; making appropriation of \$15,000 for the completion of the State Reform School buildings and grounds; establishing the northern boundary-line of the State of Rhode Island, between Rhode Island and Massachusetts; in amendment of, and in addition to, chapter 158 of the Public Statutes, "Of Railroad Corporations"; in amendment of, and in addition to, chapter 37 of the Public Statutes, "Of the Election and Qualification of Town Officers"; in amendment of chapter 163 of the Public Statutes, "Of Marriage"; in amendment of chapter 27 of the Public Statutes, "Of the Revenue of the State": SECTION 1. A tax of twelve cents on each one hundred dollars of the ratable property of the several towns, as herein set forth, shall be annually assessed, collected, and paid by the several towns to the General Treasurer, one half thereof on or before the fifteenth day of June, and one half thereof on or before Dec. 15 in each year.

On March 30th the Judges of the Supreme Court gave their unanimous answer to a resolution of the Senate requesting their opinion in regard to the legal competency of the General Assembly to call a convention for the revision of the State Constitution. They are of opinion that such power does not exist, and that the only legal mode in which changes can be effected in the Constitution is the mode pointed out in the Constitution itself for its amendment. The provision for amendment in the Constitution is singularly explicit. The proposed amendment is first to pass the two houses of the General Assembly by a majority of the members elected. It is then to be published with the vote thereon in the newspapers, and otherwise brought to the attention of the people; it is then to pass the Assembly elected after such publication by a majority of both houses; and, finally, it is to be submitted to the approval of the electors, and, if it be approved by three fifths of the electors voting (and not otherwise), it is to become incorporated in the Constitution.

The Legislature of 1882-'84 convened in Newport on May 29th, and adjourned on June 1st, to meet in Providence on the last Tuesday of January, 1884. State and county officers were elected, and a few acts were passed.

FINANCES.—The receipts from all sources from

Jan. 1, 1883, to Dec. 31, 1883, were \$930,483.43; balance in the treasury Jan. 1, 1883, \$324,919.44; payments for the fiscal year, \$889,935.96; balance in the treasury Jan. 1, 1884, \$365,416.91. The receipts were from the following sources:

State taxes and other taxes.....	\$582,114 25
Liquor-licences	71,577 83
Courts and jailers	83,706 83
Shell fisheries.....	10,737 00
State institutions, Cranston	52,583 50
School fund.....	12,053 50
Judgment against the city of Boston.....	193,981 41
Miscellaneous.....	82,379 61
Total.....	\$890,483 43

The payments were for the following purposes:

Principal and interest of State debt and sinking fund.....	\$390,291 09
Salaries.....	67,450 08
The courts, and the care and support of offenders and dependent persons	251,293 89
The military.....	23,992 97
Educational purposes.....	104,678 83
Purchase of land and erection of buildings.....	87,525 85
All other expenses.....	73,694 89
Total.....	\$839,985 96

By a vote of the General Assembly at the May session, an additional sum of \$129,981.41 was ordered to be paid to the sinking fund. The amount of the State debt Jan. 1, 1883, was \$1,615,500. The bonds outstanding, Jan. 1, 1884, were as follow:

Bonds issued Oct. 1, 1861.....	\$500 00
Bonds issued Sept. 1, 1863.....	80,000 00
Bonds issued April 1, 1863.....	11,000 00
Bonds issued July 1, 1863.....	681,000 00
Bonds issued Aug. 1, 1864.....	788,000 00
Total.....	\$1,410,500 00

To provide for the payment of the outstanding bonds the General Treasurer is required to pay annually, in January, \$100,000 into the sinking fund.

Education.—The Commissioner of Education reports the following statistics relating to schools:

Children from five to fifteen years enumerated..	58,899
Children attending public schools.....	36,109
Children attending all other schools.....	7,680
Children not attending school.....	14,610
Children attending school less than the time required by law—viz., twelve weeks.....	2,241
Number of schools.....	848
Average length of schools.....	9 mos. 4 days
Number of different pupils enrolled.....	42,671
Average number belonging.....	31,579
Average attendances.....	28,558
Number of teachers regularly employed.....	929
Amount paid teachers.....	\$412,008 76
Total receipts.....	674,395 52
Current expenditures.....	512,839 79
Permanent expenditures, buildings, apparatus, etc.....	134,925 70

State Institutions.—The appropriation for the Board of Charities and Corrections for the year was \$100,000, in addition to the amount received for labor, board of inmates, and sale of the product of the farm and workshop, which amounted to \$52,563.50. An appropriation of \$23,153.55 was also made to meet the deficiency of 1882. The board drew from the treasury the sum of \$97,011.30 in addition to the amounts received by them as above. This

sum of \$97,011.80 represents the actual cost to the State of supporting the State-Prison, the Providence County Jail, the Sockanosset School for Boys, the Oaklawn School for Girls, the State Workhouse and House of Correction, the State Almshouse, and the State Asylum for the Incurable Insane.

The number of inmates in each of the departments, December 31st, was as follows: State-Prison, 95; Providence County Jail, 174; Sockanosset School for Boys, 173; Oaklawn School for Girls, 87; State Workhouse and House of Correction, 240; State Almshouse, 200; State Asylum for the Incurable Insane, 300. Total, 1,219.

According to the practice under the present statute, insane paupers not regarded as incurable are sent for treatment to the Butler Hospital, the State aiding in their support to the extent of \$120 a year, whether they have or have not legal settlements in the town. During the year the State paid the Butler Hospital \$3,091.71, and all the towns, \$5,905.62.

The State School for the Deaf has satisfactorily continued its workings during the year. The number of pupils attending at any time was 83, the same as in the preceding year; but the average was 21.9, against 16 in 1882.

Institutions for Savings.—The amount of deposits and of profits on hand December 31st was \$52,445,334.43, an increase of \$1,787,457.63. The number of depositors was 120,482, an increase of 8,010. The average amount due each depositor was \$416.07. There has been a gratifying increase of the number of small depositors, as the number of those having less than \$500 deposited has increased 6,796.

The sum of \$15,000 was appropriated for the support of the insane poor at Butler Hospital and for the education of indigent deaf, dumb, idiotic, and blind persons, for the year 1883.

Divorce.—On this subject the Governor says:

The State of Rhode Island has acquired a reputation in regard to divorces as unenviable as it has in the matter of illiteracy. The proportion of divorces to marriages is constantly increasing. In 1882 there was one divorce to every 9.7 marriages. And when we consider that probably one third of our population are adherents of the Roman Catholic Church, in which divorces are not recognized for any cause, the proportion of divorces becomes absolutely startling. For the ten years ending Dec. 31, 1882, there were 2,824 applications for divorce in the State, of which 2,201 were granted. The large majority of these divorces were granted without opposition, and therefore upon *ex parte* depositions, which are practically only such depositions of interested parties as would make a *prima facie* case. Though the law provides that no divorce shall be granted if it shall appear that there is collusion between the parties, yet it is a well-known fact that in a large number of cases there is actual collusion, though it may not be brought to the attention of the court. About one fifth of the applications allege adultery as a cause for divorce, and yet I am informed by the Attorney-General that no prosecution for adultery was ever known to him based on evidence brought out in a divorce case. In fact, a divorce for this cause would be granted upon evidence that would not warrant for a moment the holding of a person upon a criminal charge for the commission of the crime. Our statute practically limits the causes of

divorce to the discretion of the court, and is so much more favorable to easy divorces that instances are not rare of persons coming to the State and remaining the time required to obtain standing in our courts.

Railroads.—The following are statistics of the railroads of the State for the year:

Whole number of corporations (including Ap- ponaug, operated by the New York, Provi- dence, and Boston, and no separate account kept).....	18
Total amount of capital stock.....	\$39,654,170 86
Total amount of indebtedness.....	80,778,468 28
Total receipts.....	13,094,812 58
Total expenses.....	12,254,886 46
Total net earnings.....	1,639,984 84
Total net surplus.....	2,665,962 34
Total number of passengers.....	32,871,430
Total tons of merchandise.....	4,550,314
Total miles of track in this State.....	805.147
Total number of locomotives.....	351
Total number of passenger-cars owned.....	585
Total number of all other cars owned.....	7,320

Compared with previous year the result is:

Total capital stock, <i>increased</i>	\$2,226,800 00
Total indebtedness, <i>increased</i>	4,648,718 95
Total receipts, <i>increased</i>	600,685 80
Total expense, <i>increased</i>	1,816,900 82
Total net earnings, <i>decreased</i>	481,931 54
Total surplus, <i>decreased</i>	60,881 16
Total number of passengers, <i>increased</i>	2,396,889
Total tons of merchandise, <i>decreased</i>	698,977
Total miles of track in this State, <i>increase</i>	6.795

Political.—The Republican State Convention met in Providence on March 15th, and nominated the following ticket: For Governor, Augustus O. Bourn, of Bristol; Lieutenant-Governor, Oscar J. Rathbun, of Woonsocket; Secretary of State, J. M. Addeman, of Providence; Attorney-General, S. P. Colt, of Bristol; General Treasurer, Samuel Clark, of Lincoln.

On the same day a convention of Independents in Providence nominated William Sprague for Governor, and appointed a committee of conference on the other nominations.

The Democratic State Convention met in the same city, on the 20th of March, and having nominated Mr. Sprague for Governor, in conference with the Independent committee, agreed upon the following ticket for State officers: For Lieutenant-Governor, Charles H. George, of Providence; Secretary of State, Warren R. Perce, of Providence; Attorney-General, Willard Sayles, of Providence; General Treasurer, James B. Cottrell, of Newport. Z. O. Slocum was substituted for Mr. George.

The election, on the 4th of April, resulted in the success of the Republican ticket. The following is the vote:

	Republican.	Democratic.	Independent Democratic.
Governor.....	18,068	10,201	726
Lieutenant-Governor.....	18,179	10,314	690
Secretary of State.....	18,257	10,166	678
Attorney-General.....	18,623	9,905	628
Treasurer.....	18,257	10,174	674

The Legislature chosen has 80 Republicans and 7 Democrats in the Senate, and 55 Republicans and 17 Democrats in the House.

RITUAL MURDER CASE. See AUSTRIA-HUNGARY, page 47.

ROMAN CATHOLIC CHURCH. Rome.—The most important event of the year was the seizure by the Italian Government of the property of the Congregation de Propaganda Fide. This body, one of the committees of cardinals to which the various departments of the Catholic Church are confided, controls funds and property given for missionary purposes in all countries. The Italian Government undertook to seize and sell this property, and give the Propaganda a credit for the amount in the Italian debt, paying a yearly interest. Against this the Propaganda appealed; the case was tried in the Italian courts, and finally carried to the Court of Cassation, which sustained the Government. The Congregation of the Propaganda has under its charge a great missionary college, and a printing-office established in 1626, in which religious works in a great number of languages are printed. It has also a museum, founded early in this century by Cardinal Stephen Borgia, and has a rich collection of early maps, and geographical, ethnological, and linguistic contributions from missions in all parts of the world. Cardinal Simeoni, Prefect of the Propaganda, by a circular to bishops in missionary countries, Oct. 20, 1882, appealed for further contributions to this great collection.

Among the other notable events was the opening of a college in Rome for Armenian theological students, under the direction of Cardinal Hassoun, who belongs to that rite. It had been established by Pope Leo XIII, by his brief of March 1.

On May 30, Pope Leo XIII issued a constitution in regard to the Third Order of St. Francis, a branch of the Franciscan order, embracing persons living in the world, even in the marriage state. The Pope revised and amended the rule of the order, and recommended it highly to the faithful.

On August 17 the Pope addressed a remarkable letter to Cardinals de Luca, Pitra, and Hergenroether, in which he announced that the Vatican Library would henceforth be at the service of those who were prosecuting historical labors. Under this policy, the Vatican archives had already been examined at the instance of the English Government, and copies obtained of documents supplementing what was already known of various important events.

On September 12 the Pope issued an encyclical to stimulate Catholics throughout the world to resort to the devotion of the Rosary, to which, in Catholic annals, the victories of Lepanto and Vienna, which saved Christendom, are especially ascribed.

On October 7 he received in St. Peter's a great pilgrimage from all parts of Italy, and replied to the address by Count Viancino.

The venerable Father Beckx, General of the Society of Jesus, feeling the infirmities of age, sought to retire, or be aided in his duties. For the first time in the history of the order, a co-adjutor to the General was elected by the procurators of the various provinces assembled in

general congregation. The choice devolved on Father Anderledy, who had for a time been a missionary in the United States.

No new promotions of cardinals were made during 1883, and several members of the Sacred College died: Cardinal Ignatius Moraes Cardoso, Patriarch of Lisbon (Feb. 24); Cardinal Deschamps, Archbishop of Mechlin (Sept. 29); Cardinal Henry Mary Gaston de Bonnechose, Archbishop of Rouen (Oct. 28).

Ireland.—On the first day of the year 1883 Pope Leo XIII addressed to Cardinal McCabe, Archbishop of Dublin, an important brief in regard to the agitation in Ireland, in which he said:

The adherents of evil societies, as we have been grieved to observe during the past months, do not cease to put their trust in deeds of crime to excite the passions of the people, and, by seeking remedies worse than the disease, to adopt a course calculated to lead their fellow-countrymen, not to safety, but to destruction. Hence the faithful people should be firmly persuaded, as we have already reminded them, that the standard of utility and honesty is one and the same; that the national cause should be kept distinct from the aims, purposes, and deeds of unallowed associations; that while it is just and lawful for those suffering oppression to seek their rights by lawful means, it is not allowable to make use of the protection which crime affords; and that Divine Providence allots to the virtuous the enjoyments of the fruits of patience and well-doing, but subjects the evil-disposed, after their fruitless labors, to heavy punishment from God and men. While we thus speak from our earnest desire for the relief, peace, and happiness of Ireland, we have no doubt that you, our beloved son, and your venerable colleagues in united counsels and brotherly love, will continue to keep your faithful people entirely apart from those who, led away blindly by their own passions, think that they can serve their country by steeping themselves in crime, by drawing others into the same depraved courses, and imprinting a foul stain upon their country's cause. We rejoice, beloved son, that you have lately so effectively discharged this priestly zeal when, in view of the snares and dangers prepared for the Catholic youth of Ireland, you issued a pastoral letter in which you publicly denounced those dangers, stirred up the faithful to vigilant care, and consulted at once for their salvation and for the interests of religion and your country. These grave duties of the pastoral office and the public interests of the Irish people imperatively demand that the clergy should give every assistance to their bishops, in calming the passions of their countrymen and checking public disturbances.

For the proper exercise of this salutary influence of the sacred ministry—especially when the question of popular meetings in which affairs are very warmly discussed and dissensions arise—we deem it a wise plan if, adhering strictly to the decrees you have already made regarding the junior clergy, you would give leave to attend such meetings only to those ecclesiastics in whose wisdom you have special confidence, whose mature age and experience have rendered them conspicuous for prudence, wisdom, and weight, and who are, therefore, best able to guide an excited assembly to what is right and honest, to meet the fallacies of the evil-disposed, to guard the cause of justice, and be the best defender of the most judicious courses.

The exhortations of the Holy See were renewed by the Archbishop of Tuam and other members of the Irish hierarchy in their pastoral letters. In the course of time the Parnell testimonial fund was started, and collections were made in some parts of Ireland in the

Catholic churches. This elicited from Cardinal Simeoni a circular letter to the bishops, in which he said:

It is not forbidden to collect money to better the condition of the Irish people, but, according to the apostolic commands, collections are to be positively condemned which are avowedly intended to inflame still more the passions of men, so that leaders may easily abuse them to form wild plots against the laws. But most especially are they to keep aloof from such movements, when it distinctly appears that they tend to excite hatred, to assail the character of eminent men, and utter no condemnation of crimes and assassinations with which wicked men dishonor themselves; and most of all when it is put forth that real love of country is to be gauged by the amount of money contributed or refused, so that men are driven by a kind of force or fear to take part in them.

Germany.—The situation of the Catholic Church in Germany began to improve during 1883. Negotiations were carried on at Rome, and some concessions were made. A Catholic relief act, mitigating to some extent the severity of the Falk laws, passed the lower house of the Prussian Parliament, June 25, and became a law July 17. The condition of the Church had by this time become one of great distress: 8,000 priests were in exile; in the archdiocese of Posen, 171 parishes, containing 800,000 Catholics, were without parish priests, and 185 of them without clergy of any kind; in the archdiocese of Cologne, 286 parishes out of 818 were deprived of priests; in the diocese of Münster, 187 were vacant.

The Relief Act enabled bishops to perform episcopal acts, even out of their own dioceses, and to appoint vicars, chaplains, etc., in vacant parishes. The celebration of mass by priests not authorized by the Government was no longer a criminal offense, and the right of appeal to the Minister of Public Worship was granted.

The organization of the Catholics in Germany, called forth by the oppressive acts of the Government, continued active, as was shown by a general meeting of delegates at Düsseldorf, in Prussian Rhineland, in September.

France.—The course of the Government of the French Republic during 1883 was hostile to the Catholic Church, which was that of the vast majority of its citizens. Seminarians in their theological course were made subject to conscription, and compelled to serve in the ranks; clergy were made subject to be deprived of their stipends at will; religious instructions and emblems were removed from the schools, and books of morality, written by avowed infidels, were introduced. In the same spirit the Municipal Council in Paris suppressed the chaplaincies in the hospitals, closed the chapels, and forbade visits by the clergy, unless in cases where they were specially summoned by the patients. This was done against the protest of the Archbishop of Paris. In June Pope Leo XIII addressed a letter to President Grévy, personally urging him to exert his influence to secure a more just and equitable policy. The French Cabinet decided

that the President should answer the letter personally, not officially.

Belgium.—Belgium, imitating the policy of France, adopted a line of proceeding to diminish the influence of the Catholic Church. Religious teaching was suppressed in the schools, and (June 26, 1883) a law was passed making theological students liable to conscription. The Catholic party established schools of their own in which the pupils increased from 580,380 in 1880 to 622,437 in 1882.

A curious case in the Belgian and American courts resulted, August 14, in the acquittal of Canon Bernard, who had been arrested in America for embezzling the funds of the diocese of Tournai. The bishop of that see, Mgr. Dupont, becoming more or less insane, was removed by the Pope, who appointed Bishop Rousseaux to the management of the diocese. Bishop Dupont, however, endeavored to gain possession of the diocesan funds, and the Government claimed that the funds really belonged to the state. Canon Bernard, acting under orders to remove the funds, brought them to the United States. As there had been no misappropriation, his innocence was recognized.

Louise Lateau, the stigmatica of Bois d'Haine, died there on August 24. She was born Jan. 30, 1850, and from childhood was noted for her piety and charity, especially in the cholera-season of 1866. She was prostrated by a lingering malady the following year, and the stigmata, or wounds like those of Christ, began to appear in 1868, that in the side being the first. She was also declared to have lived without food from 1871. Her case excited much attention, and for a considerable period her symptoms were examined by medical men of all opinions. By Catholics generally the facts were accepted as well established, and she was regarded as one of those recorded to have received the stigmata, St. Francis of Assisi being the first. Others, however, impeached the evidence and denied the facts.

A congress, theological and devotional, was held at Liège, Belgium, June 5-10, 1883, called the Congress of Eucharistical Works.

Switzerland.—Early in the year an attempt was made to give the Catholic cantons representation in the Federal Council, from which they had been excluded for thirty years, but the project failed. The position of the Catholic Church, however, was improving; Mgr. Mermillod, Bishop of Lausanne and Geneva, who had long been in exile, was permitted to return. The Old Catholic body, though supported by the Government, had not gained ground, and was unable to retain the Church of St. Joseph, which had been taken from the Catholics, who accordingly recovered it.

Austria-Hungary.—The year was marked by a great national pilgrimage to the tomb of St. John Nepomucene, at Prague, in May, and by the religious and national celebration in Austrian Poland of John Sobieski's victory over the Turks at Vienna in 1683. During the

year the laws making seminarians amenable to military service were to some extent a dead letter.

Russia.—The negotiations which Pope Leo XIII had conducted with the Emperor led, early in 1883, to a greater prosperity for the Catholic Church in the Russian dominions than it had enjoyed for many years. With the consent of the Russian Government, the Pope appointed twelve bishops to sees which had long been vacant. Numbers of priests were allowed to return from exile. The Catholic Metropolitan of Russia, Mgr. Fialkowitzki, Archbishop of Mohilev, died on Feb. 11.

United States.—The Catholic Church in the United States, at the close of 1883, had 13 archbishops, 57 bishops, 6,885 priests, and 6,613 churches—an increase of 289 priests and 372 churches since 1882. The total number of Catholics is uncertain, the estimates being, as far as statistics can be depended on, below the real population, which, judging by the ratio of births and deaths, must exceed 7,500,000. In Vermont, of 7,850 children born, 2,087 were baptized in Catholic churches; the ratio of births to population is 1 to 45·2, but the Catholic population is estimated at only 86,000, when probably 50,000 would be nearer the truth. Of 90,980 births in Ohio, 16,216 were baptized in Catholic churches.

A provincial council, called at New York, met on September 23. Besides the cardinal, who presided as Archbishop of New York, it was attended by seven bishops of New York and New Jersey, and the Coadjutor Archbishop of New York. The decrees of the Council were transmitted to Rome for approval. About the same time the Pope called the various archbishops of the United States to Rome to discuss the matters to be treated in a Plenary Council of the whole Church in the United States, to be held in Baltimore in 1884. As several of the archbishops were unable from ill health to go, bishops from the provinces represented them and vacant sees. Many sessions of the American archbishops and bishops were held, and various points relating to the adaptation of the law governing the Church in the United States to the general law of the Church, and to the position of affairs in this country, were finally settled upon.

The celebrations in the year showed a strange contrast. The Jesuits celebrated April 17, the 250th anniversary of the founding of a mission of their order in Maryland, at the very outset of its colonization; and Chicago, now the see of an archbishop, celebrated the 50th anniversary of the erection of the first Catholic church, May 27; and the first resident priest at Chicago, Rev. J. M. J. St. Cyr, almost witnessed the celebration, dying Feb. 21.

Several cases touching the Catholic Church were before the courts in 1883. In March, Chief-Justice Morton, of the Supreme Court of Massachusetts, decided that a bequest of money to have masses said for the soul of the

testator was valid; but in another case in New York in June, Judge Freeman, of an inferior court, held such a bequest invalid.

Churches for colored Catholics were dedicated during the year in Baltimore and New York, and a Colored Home for the Aged at Louisville, Ky.

Canada.—The Catholic Church in Canada, and adjacent provinces, in 1883, had 5 archbishops, 25 bishops, 2,082 priests, and 1,699 churches, with a population of 2,082,895.

The pilgrimage to St. Anne at Beaupré was increased greatly from all parts of Canada.

A difficulty arose in connection with the establishment of a branch of the University Laval, of Quebec, in Montreal. Bishop Conroy, at the time of his death, had made progress in adjusting the questions regarding the succursal Medical College of Laval University and the Hôtel Dieu, Montreal, but new difficulties arose, which even injunctions from Cardinal Simeoni failed to remove. A new apostolic delegate, Mgr. Henry Smeulder, was sent out and made his solemn entry into the Basilica, Quebec, Oct. 22, 1883. The questions at issue were still undecided.

Chili.—The Spanish-American republics claim the right of patronage granted by Pope Julius II to Philip II, and under it assume the right of nominating bishops. This has led to frequent vacancies, as the candidates presented are not always such as any Pope can conscientiously appoint. In Chili the Government nominated Mgr. Tafaro for the archbishopric of Santiago; the Pope declined to appoint him, and finally sent Mgr. del Mate as delegate to Chili, to endeavor to adjust the difficulty; but the Chilean Cabinet almost immediately sent him his passports.

Australia.—The Catholic Church in Australia sustained a great loss in the death of Archbishop Roger Bede Vaughan, of Sydney, who died suddenly while in England, Aug. 18, 1883.

Foreign Missions.—The Catholic missions in Anam and China were involved in great danger by the French operations in Anam, as they led to a general exasperation against all Christians supposed to be connected with France. The Rev. M. Béchet, of the Seminary of the Foreign Missions, Paris, was decapitated, May 1st, in the province of Thang Hoa, Tonquin. The Abbé Terrasse was put to death at Yunnansen, China, and about 70 native Christians were driven from their homes and put to death. The church in Anam contained six vicariates apostolic, with 396 priests and 501,223 Christians, exclusive of the part under French rule, which contained 98 priests and 65,242 Christians.

In Madagascar Father Gaston de Batz and Brother Martin Brutal were starved to death at Mananzary, July 28 and 29.

The revolt of El Mahdi in the Soudan broke up all the Catholic missions, and the clergy fell into his hands, but no details of their fate have been obtained.

At Colombo, in Ceylon, on Easter-day, the Buddhists, at the instigation of a fanatic bonze, got up a procession near the Catholic cathedral, bearing a crucified monkey, grotesque figures in derision of the Virgin Mary, and other emblems intended to provoke the Christians. A bloody riot ensued. The trouble spread, and several Catholic churches in the rural districts were burned or pulled down.

ROUMANIA, a kingdom of Eastern Europe, formerly a province of Turkey. Absolute independence was proclaimed May 22, 1877, and was recognized by the powers at the Congress of Berlin, June 13, 1878. The principality of Roumania was erected into a kingdom March 26, 1881. The Constitution was elaborated by a Constituent Assembly in 1866. It delegates the legislative power to the Senate, of 70 members, and the Chamber of Deputies, of 145 members. Every citizen who pays taxes is a voter. The electoral colleges are four in number, corresponding to four classes of voters.

The King, Carol I, the son of Prince Hohenzollern-Sigmaringen, was born April 20, 1839. He was elected Prince of Roumania in 1866, after the abdication of Couza, who was elected Hospodar of Moldavia and Wallachia in 1859, and assumed the title of Prince Alexander John I upon their union into the Principality of Roumania in 1861. The executive authority is exercised by a council of seven.

Area and Population.—The area, as fixed by the Treaty of Berlin, is about 49,979 square miles. The population of the kingdom is known only by estimates. The official estimate of the total population in 1882 was 5,376,000. In Roumania, as it was before the Treaty of Berlin, the estimated population of 5,078,000 souls included 772,700 strangers.

About 4,529,000 of the inhabitants of Roumania proper belong to the Greek Orthodox Church, 114,200 are Roman Catholics, 400,000 Hebrews, 13,800 Protestants, 8,000 Armenians, and 2,000 Mohammedans. The capital, Bucharest, contains 221,000 inhabitants; Jassy, 90,000; Galatz, 80,000. The number of marriages in 1882 was, exclusive of the Dobrudja, 44,242; births, 191,653; deaths, 184,627.

Commerce.—The imports increased from 82,927,228 lei (the leu is the equivalent of a franc) in 1871 to 255,338,415 lei in 1880, 274,757,458 in 1881, and 268,850,921 lei in 1882; the exports from 177,682,783 lei in 1871 to 218,918,878 in 1880, 206,518,317 in 1881, and 244,730,199 lei in 1882. The commerce with the principal foreign countries in 1881 was in round numbers as follows, in lei:

COUNTRIES.	Imports.	Exports.
Austria-Hungary.....	188,000,000	72,100,000
Great Britain.....	50,500,000	52,200,000
Germany.....	81,800,000	1,800,000
France.....	22,700,000	19,800,000
Turkey.....	16,400,000	11,400,000
Other countries.....	19,800,000	19,900,000
Total.....	274,700,000	206,000,000

The values of the principal classes of imports and exports were as follow :

CLASSES OF MERCHANDISE.	Imports.	Exports.
Cereals.....	5,600,000	157,200,000
Animals.....	5,000,000	16,600,000
Hides, leather, and manufactures.	86,500,000	1,800,000
Timber and manufactures of wood	18,900,000	5,200,000
Textile materials and manufactures.	98,400,000	7,100,000
Metals and manufactures thereof.	48,600,000	700,000
Vegetable oils.....	8,800,000	
All other articles.....	60,400,000	17,400,000
Total.....	274,400,000	206,000,000

The number of vessels entered at Danubian ports in 1880 was 19,875, of 2,969,848 tons; number cleared, 18,564—tonnage, 8,174,181.

Communications.—Railroads have contributed greatly to the development of Roumanian commerce and industry. The first line was built in 1869, to connect Bucharest with the Danube at Giurgevo. On July 1, 1882, there were 914 miles completed and 568 miles in the course of construction. Nearly the entire network was constructed by the state. The cost was 376,450,000 lei; gross receipts in 1881, 22,800,745 lei; expenses, 16,854,441 lei.

The length of telegraph lines in 1882 was 4,622 kilometres; length of wires, 9,640 kilometres; messages sent in 1882, 1,218,908; receipts, 4,076,921 lei; expenses, 8,659,549 lei.

The post-office forwarded 15,432,128 letters, newspapers, and packets, in 1882.

The Army.—By the law of 1868, last modified by the act of June 8, 1882, the military forces are composed of the permanent army and its reserve and the territorial army and its reserve, constituting the active army, the militia, and the civic guard in the urban, and the levy in mass for the rural communes. All Roumanians are obliged to serve three years in the active and five in the reserve permanent army, or the same period in the territorial army; or, if legally exempt, are enrolled in the militia, together with those who have completed their term of service, until they have passed the thirty-sixth year of their age, from which time of life they are inscribed for ten more years in the civic guard, or *levée en masse*. The effective of the permanent army in time of peace is 19,812 officers and men, with 2,945 horses and 180 pieces of artillery. The strength of the territorial army is about 100,000 men, with 90 cannon. There is a naval force of four dispatch-boats, three gunboats, a torpedo-boat, and eight launches for the Danube police.

Finances.—The capitation-tax of nine lei, or francs, with a higher rate for merchants, was reduced to three francs per head of the peasant population on the 1st of January, 1882. The state derives the chief part of its revenue from this source, from its valuable domains and salt-mines, and from tobacco and salt monopolies.

The budget for 1882-'83 states the revenues as follow :

RECEIPTS.	Lei.
Direct taxes.....	25,190,000
Indirect taxes.....	51,896,000
Domains.....	18,461,000
Ministries.....	17,262,523
Miscellaneous.....	7,317,923
Tithe of direct taxes for collection.....	2,519,000

Total revenue..... 122,627,044

The following were the main heads of the budget of expenditures:

EXPENDITURES.	Lei.
Public debt.....	45,456,481
War Ministry.....	26,404,583
Ministry of Finance.....	13,755,997
Ministry of the Interior.....	9,705,930
Worship and Instruction.....	11,581,800
Public Works.....	8,706,960
Ministry of Justice.....	4,276,496
Foreign Affairs.....	1,550,001
Council of Ministers.....	63,540
Reserve fund.....	1,874,600

Total..... 122,627,044

The public debt has been contracted since 1864. Two thirds of the borrowed sums have been employed in the construction of railways. A sinking fund exists for the redemption of all loans between 1888 and 1968. The principal loans bear interest at 5 and 6 per cent. The nominal amount of the debt, April 1, 1883, was 593,191,006 lei. About one third was held in the country, and the rest mainly in Germany.

The Danube Question.—The form in which the jurisdiction of the Danubian Commission was prolonged was an infringement on the independence of Roumania. In the Berlin Treaty, as well as in the previous ones, the principle of the equal rights of all the sovereign riverain states was not denied. International law furthermore universally intrusts to the immediate riparian states the administration of regulations for international rivers. Yet at the London conference which, in February, extended the powers of the commission for the minimum term of eighteen years, and extended its jurisdiction to Galatz, Roumania was offered only a deliberative voice, while Austria was by a fiction granted the privileges of a riverain state for a stretch of 1,221 kilometres where it is none. This result, compromising the rights of Roumania and humiliating to national feeling, she has striven for years to prevent. When it was finally accomplished, the anti-German feeling in Roumania rose to a dangerous pitch. Gen. Brialmont, the distinguished Belgian engineer officer, was summoned to Roumania to plan a system of fortifications for the frontier and the capital. Senator Gradisteano, on the occasion of the unveiling of a monument of Stephen the Great at Jassy, uttered belligerent threats against Austria. The difficulties of this young and striving nation, situated within the circle of the Eastern maelstrom, and in danger of being swept away by one or the other of the mighty powers on either side, suggests in critical emergencies desperate action, to which the hot and eager temperament of the Roumanian people is prone. Obligated to maintain an army in a constant state of preparation for war,

an army whose efficiency and bravery is proved, and which taxes the resources of the country severely—although they have thus far expanded since the Russian war under this burden and that of a heavy debt for railroads which do not yet pay interest and expenses—the Roumanians have a chance of not only maintaining, but of improving, their position by precipitating the conflict between Russia and Austria. Whichever side they aid with their formidable military resources, there is a large piece of “unredeemed” Roumanian soil to be annexed as the fruit of victory. There are between 3,000,000 and 4,000,000 Roumanians in the adjacent portions of Hungary and Russia. The district which could be claimed on the ground of nationality in Transylvania and Northwestern Hungary is the most extensive and valuable. The Roumanians of Bessarabia, however, are related to the country by a closer tie. They were faithful subjects of King Carol until separated by the Treaty of Berlin. That experience stands in the way of an alliance with Russia. When no power would aid Roumania in maintaining the neutrality of her soil, she was obliged to become the partner of Russia in a costly war. The important services rendered by the Roumanian troops at Plevna helped to turn the scale of victory. Yet they were requited by the annexation to Russia of the province of Bessarabia. The Dobrudja and its ports, and the decree of independence, are not considered in Roumania sufficient compensation for the loss of Bessarabia. Of the two ports, Kustendje alone will be utilized, and to render that one available, five years more of time and the expenditure of 20,000,000 francs in the construction of a bridge and harbor will be required. The withdrawal of the Kilia branch of the Danube from the jurisdiction of the International Commission was a fresh warning of the danger from the side of Russia. (See DANUBE, EUROPEAN COMMISSION OF THE.)

More sleepless and constant, however, than jealousy of Russia, is the mistrust of German influence and Austria, because the policy of the King and of the present Government lays them open to attacks, on the ground of subservience to German interests. The King, as a Hohenzollern, had difficulty in winning the confidence of the people. He maintained his position by sinking his nationality, and taking the lead in Roumanian national tendencies and aspirations. His present advisers have gained the confidence of the country by the tact and devotion with which they have served the cause of national independence, but their attitude toward the German powers is sometimes called in question. French political influence has vanished from Roumania, but French thought is not extinct. The Germans have pursued their commercial expansion in Roumania more actively than in any other part of the East, attracted by the richness of the country, and by its social and political condi-

tions. Their economical dependence upon German capital is a source of uneasiness and fear to the Roumanians. A sign of this feeling is the recent action of the legislature in enhancing the disabilities of foreigners to hold land, etc., instead of sweeping them away, so as to promote the inflow of German capital. Their sensitiveness, on account of the expansion of German energy and culture, is as great as that of any of the Slav *peuplades* of the Balkans. A Roumanian Government could not venture to show too great complaisance to Austria. To the Germans an independent Roumania is a bastion to shield the “civilizing mission” of the German race in the Orient, a dam against the “Slavic deluge”; while to the Russians it is an obstacle in their path to Constantinople, to be eventually erased from the map.

Political Parties.—The Red, or Democratic party, which has guided the state during a period of remarkable development and progress, has governed for many years without an organized and permanent political opposition. Rosetti's electoral reform project raises the old class conflict, and produces dissension in the dominant party. The Reds, inspired with the ideas of French liberalism, emancipated the serfs and expropriated the landlords. The Whites, or Conservatives, overthrew the Government, drove out the reforming Hospodar, Colonel Couza, and set a German prince on the throne; but, as they could not undo the great reform, they had to resign the helm again into the hands of the Reds. They only succeeded in making a better bargain for their lands. Rosetti was the man of ideas, but Bratiano and other practical statesmen took the direction of the Government. The Boyar families were many of them won over, while Cogelniceano and the men who were identified with Prince Couza's revolutionary reforms were left out. The Reds thus became merged in the National-Liberal party. The excluded Radicals were an insignificant group. The Conservative Opposition, though few in number, were politically powerful until they melted away to a small remnant. The qualified acceptance by the Government of Rosetti's project, revived the conflict between democratic and oligarchic elements. His plan is to abolish the distinct electoral colleges, and have the great proprietors with incomes of over 300 ducats net, the intermediate class, with 100 ducats of income from real property, and the indirect peasant voters, elect their candidates to the Chamber together. The question was not decided by the general election to a Constituent Assembly, which took place in May. The regular Opposition won only 13 of the 145 seats in the Chamber, while the Government obtained more than the necessary two-third majority in the Senate. This and the other internal reforms which the Constituent Assembly have to consider, were obscured by the conflicts and intrigues to which the understanding arrived at between the

Austrian and Roumanian cabinets gave rise. The Old Conservatives, who lean toward a Russian connection as the means of preserving the class privileges of the great families, uttered covert threats of revolution and dethronement. A pretender, Prince Bibesco, has laid plans to contest the succession to the throne with the King's brother or nephew, who are his constitutional successors, as he has no male issue. The Young Conservatives approved the foreign policy of the Government. The group which calls itself the Pure Liberals, accused the ministers of reducing the country to vassalage under Austria and Germany, and submitting to the dictation of Prince Bismarck.

Reform Legislation.—The Legislature which reassembled in November, is intrusted with the revision of three articles of the Constitution. One of the projected reforms is an alteration in the militia system, which provokes no opposition. On Rosetti's scheme to extend suffrage and unite the three classes of electors, the Government party is divided. The third change is reactionary. It is to extend to thirty-two years the period during which the peasantry are not allowed to sell their lands. The Liberal opponents of the Government, who receive support and encouragement from Russia as well as the Conservatives, make this obnoxious proposal the ground of a popular agitation. The people are invited to compare their condition with that of the Servians and Bulgarians, who enjoy more political liberty and individual rights than the Government is ready to accord to them. The emancipated serfs are taught to believe that they should have received their farms as a gift, instead of paying a heavy price to the former serf-proprietors. The idea of a natural ownership in the soil is a logical outgrowth of the condition of being bound to the land. Personal liberty without land, therefore, seems to them a delusion, particularly since the quantity of land apportioned to them, and the conditions of payment and amount of the remuneration exacted by the proprietors, were such as to deprive their liberation of its virtue to a considerable extent. The peasantry, therefore, now clamor against the sale of the public lands, and demand that they should be restored to their rightful owners. The agitation reached such a height in the autumn that whole communes refused to pay to the Government the annual quota of the purchase-money for their farms.

RUSSIA, an empire in eastern Europe. The law-making, executive, and judicial authority is concentrated in the person of the Emperor, who is also the spiritual head of the Church. The government of the country is under the supreme direction of the Emperor's private Cabinet. Subordinated to the Imperial Cabinet is the Council of the Emperor, divided into a legislative, an administrative, and a financial department, the functions of which are to superintend the administration of the laws, and

to suggest alterations and amendments. A second great council is the directing Senate, which is the highest court of judicature, besides exercising a control over the other tribunals of the empire. It is divided into eight sections, each of which acts as the court of final resort in a particular branch of the law. A third great governing body is the Holy Synod, directing ecclesiastical affairs. All its decisions must be ratified by the Emperor.

The Imperial Cabinet is divided into eleven departments. The Minister of the Imperial Household is Gen. Count Vorontzoff Dashkoff, who succeeded Count Adlerberg in 1871. The Minister of Foreign Affairs is Nicholas de Giers, who was the practical head of the department for some years before the retirement of Prince Gortchakoff in March, 1882. The Minister of War is Gen. Vannovski, appointed in March, 1881. The Minister of the Interior is Count Tolstoy, who succeeded Gen. Ignatieff in June, 1882. Baron Nicolai took the place of Count Tolstoy as Minister of Public Instruction. The Minister of Finance is M. Bunge, successor to Count Abaza. The Minister of Domains is M. Ostrovski. The Minister of the Navy, which is under the command of the Admiral-General, the Grand Duke Alexia, is Vice-Admiral Chestakoff. The Minister of Public Works is Vice-Admiral C. Possiet, appointed in 1874. All the ministers and chiefs of superior administrations are members of the Committee of Ministers, which is presided over by Secretary of State Reutern.

The Lieutenant of the Emperor in the Caucasus is Prince Dondoukoff-Korsakoff. The chief of the first section of the Privy Council is Secretary of State Taneieff; of the second, Marcus. The adjunct in charge of the third section is Secretary of State Delianoff. The President of the Council of the Empire is the Grand Duke Michael; the heads of the three departments are Prince Ourousoff, M. Titoff, and Admiral Metline. The head of the Ministry of Justice is Secretary of State Nabokoff. The President of the Holy Synod is Isidore, Metropolitan of Novgorod, St. Petersburg, and Finland; the Procurator-General, M. Pobedonostzeff. The Comptroller-General of the Empire is Secretary of State Solski.

Area and Population.—The area of the Russian Empire is 21,702,280 square kilometres, or 8,387,816 square miles. The total population, according to the latest estimates, is 100,372,562. The following table gives the area and population of the main political divisions of the empire:

DOMINIONS.	Square kilometres.	Population.
Russia in Europe.....	4,883,718	73,731,898 ('80)
Kingdom of Poland.....	197,810	7,245,419 ('80)
Grand Duchy of Finland.....	378,608	2,081,612 ('81)
Caucasus.....	472,666	6,087,589 ('80)
Transcaucasian territory.....	327,063	208,000
Siberia.....	12,493,109	8,947,908 ('80)
Central Asia.....	8,017,760	5,075,666 ('80)
Russian Empire.....	21,702,280	100,372,562

European Russia is divided politically into fourteen general governments, or viceroyalties, and fifty-one governments. The governors-general have discretionary powers in all affairs, civil and military. Geographically and ethnographically it is divided into Great Russia, containing 880,798 square miles and a population in 1879 of 26,864,757 souls; Little Russia, containing 80,226 square miles and 8,806,895 inhabitants; Eastern Russia, containing 546,470 square miles and 17,218,607 inhabitants; South Russia, containing 168,881 square miles and 6,857,949 inhabitants; Western Russia, containing 161,897 square miles and 11,508,248 inhabitants; and the Baltic provinces, containing 57,267 square miles and 3,743,856 inhabitants. The government of Poland, which was formerly separate, was finally merged in that of Russia by a ukase issued Feb. 23, 1868. Various provinces have their peculiar institutions and customs. The Baltic provinces enjoy particular rights, but these have been much modified lately. The Grand Duchy of Finland preserves its separate government and representative institutions.

The average density of the population of Russia in Europe, including Poland and Finland, is forty persons to the square mile; that of Asiatic Russia two to the square mile; that of the entire empire twelve to the square mile. According to official returns for 1867-'70 the natural increment of the population of the empire is about 781,000 per annum.

The Slav population of European Russia is divided into three groups—the Great Russians, or Veliko-Russ; the Little Russians, or Malo-Russ; and the White Russians, or Bélo-Russ. The Great Russians, inhabiting the central provinces, number about 35,000,000 souls. The Little Russians, some 11,000,000 in number, constitute the bulk of the population of Poltava, Kharkov, Ohernigov, Kiev, Volhynia, Podolsk, Ekaterinoslav, and Taurida. The White Russians, numbering about 3,000,000, are distributed over the provinces of Mohilev, Minsk, Vitebsk, and Grodno.

The area in square kilometres and estimated population of the provinces of Central Asia in 1880 were as follow :

GOVERNMENTS.	Area.	Population.
Uralak	366,402	525,382
Turgak	523,656	320,075
Akmolinak	545,389	456,325
Semipalatinsk	487,678	526,380
New territory on the Black Irtysh	24,167
Semiretobensk	402,202	685,945
Russian part of Id.	11,238	70,000
Fergana	72,684	868,000
Zarshaban	50,980	351,897
Syr Daria	439,990	1,109,542
Amu Daria	108,585	222,200
Central Asia	3,017,760	5,075,696

The number of crown peasants liberated by the late Emperor was 22,225,075. The number of serfs belonging to nobles and other private owners who were emancipated according

to the decree of March 3, 1861, was estimated to be 22,000,000. The number of owners was 109,340. The peasants paid for the lands allotted to them on a scale by which the value of their previous labor was capitalized at 6 per cent. interest. Of the capital sum 20 per cent. was paid down by the peasant and 80 per cent. advanced by the Government, to be repaid with interest by the peasant in forty-nine annual installments. Of the cultivable land of Russia proper about 5 per cent. is held by former serfs, and 15½ per cent. by crown peasants, while 84½ per cent. belongs to the state, 20 per cent. to nobles and other great proprietors, and 20 per cent. is the property of other owners or is unsurveyed, and the remaining 5 per cent. town lands and mining property.

The movement of population is reported for 1880 in Russia, Poland, and Siberia, and for 1881 in Finland, as follows:

DOMINIONS.	Marrings.	Births.	Deaths.	Excess of births.
European Russia.....	725,427	3,678,071	2,684,838	993,243
Poland	62,771	324,031	189,514	104,507
Finland	14,258	74,459	58,777	20,682
Siberia	32,903	180,302	181,798	49,009

The following is a list of the cities which contained at the latest returns more than 100,000 inhabitants :

CITIES.	Population.
St. Petersburg (1890).....	861,920
Moscow (1882).....	750,867
Warsaw (1882).....	406,261
Odesa (1882).....	217,000
Riga (1881).....	168,844
Kiehnov (1880).....	180,000
Kiev (1874).....	127,261
Saratov (1880).....	106,588
Kharkov (1879).....	102,050

Roman Catholics are most numerous in the formerly Polish provinces, Lutherans in the provinces of the Baltic, and Mohammedans in Southern Russia, while the Jews are almost entirely settled in the towns and larger villages of the western and southwestern frontier districts.

Education.—The empire is divided into nine educational districts, over each of which a curator is appointed. There are nine universities, attended in 1878 by 6,350 students. There were in 1876 24,456 elementary schools, with 1,019,488 pupils. The number of pupils in the normal schools in 1877 was 4,596; the number in the lyceums, gymnasia, and other secondary schools was 88,400. In the budget for 1882, 18,030,867 rubles were appropriated for public education. In 1860 only 2 per cent. of the recruits for the army could read and write; in 1870, 11 per cent. In Finland all of the population who are of adult age are able to read, if not to write.

Commerce.—The following table shows the growth of the export commerce in ten years, giving the value of the merchandise exported each year to Europe and the West, to Finland, and to Asiatic countries, in millions of rubles and tenths of millions:

YEAR.	Europe.	Finland.	Asia.	Total.
1872	811·6	6·2	9·8	827·1
1873	845·9	8·8	9·8	864·5
1874	411·9	10·8	10·8	481·8
1875	860·6	11·8	9·6	882·0
1876	879·8	12·0	9·4	400·7
1877	509·8	12·8	6·9	528·0
1878	596·5	12·8	9·8	618·1
1879	606·4	10·8	10·5	627·7
1880	476·4	9·6	12·7	498·7
1881	481·8	12·0	13·1	506·4

The following table, corresponding with the above, shows the development of the import commerce during the same period :

YEAR.	Europe.	Finland.	Asia.	Total.
1872	407·7	8·8	19·2	485·2
1873	412·5	9·5	21·0	448·0
1874	440·9	10·7	20·5	471·4
1875	398·9	11·8	20·8	581·0
1876	449·8	10·8	24·5	477·8
1877	291·5	9·0	20·5	321·0
1878	557·7	9·8	28·1	595·6
1879	548·3	9·2	30·3	587·7
1880	518·8	11·4	38·0	622·7
1881	476·1	10·4	31·2	517·7

The following table shows the extent of the commerce in 1881 with each of the principal foreign countries :

COUNTRIES.	Imports.	Exports.
Germany	219,901,000	148,881,000
Great Britain	108,441,000	156,795,000
France	19,546,000	58,484,000
Austria-Hungary	28,091,000	28,108,000
Belgium	27,692,000	28,567,000
Netherlands	4,737,000	28,889,000
Turkey	2,867,000	9,584,000
Italy	9,585,000	4,718,000
Sweden and Norway	6,217,000	10,288,000
Denmark	721,000	2,388,000
Greece	2,567,000	1,948,000
Roumania	945,000	8,160,000
United States	18,815,000	381,000
South America	14,681,000
China	30,347,000	2,681,000
Persia	7,636,000	3,869,000
Other countries	20,643,000	9,015,000
Total commerce	530,222,000	494,438,000

The gold-mining industry, which produces about 40,000,000 rubles a year, is believed to be capable of great improvement. Alluvial mines in the Altai mountains produced 6,739,825 rubles of gold in 1888. It was formerly necessary to import the sulphur from abroad, but rich sulphur-mines have been discovered on Lake Baskunjak, and near Kazan. Valuable zinc-mines have been found near Khodjent, in Turkistan. The notion that the gold production of Russia is diminishing is contrary to the facts. The aggregate product of the crown works for fifty years, from the time of the introduction of quartz-mining down to 1869, was 84,960 kilogrammes, of the value of 100,000,000 rubles, of which the cost of working was 56,000,000 rubles, leaving a net profit of 44,000,000. In the private works 146,912 kilogrammes were taken out, yielding 23,000,000 rubles in royalties to the Government, and 78,000,000 rubles in net profits to the private owners. The production has steadily increased, particularly since the transfer of Government

works to private individuals. In 1868 the number of mines and diggings in Siberia was 993, the number of persons employed 56,260, the output 26,376 kilogrammes. In 1877 the quantity got out was 89,000 kilogrammes, and the number of persons employed 66,127. The mining industry in the Altai is on the decline, although the deposits of gold and argentiferous lead-ore are as far from being exhausted as they are in the Ural. In the course of the hundred years from 1745 to 1845 there were mined 1,282,000 kilogrammes of silver, and 34,856 of gold, of the total value of 138,000,000 rubles. Now most of the mines are flooded with water, and the mining authorities recoil from the expense of placing them again in working order. The platinum product of the Ural is comparatively small, amounting in the year 1876 to 1,550 kilogrammes. The greater part of the platinum is exported, since the Government gave up minting coins of this metal. Rich silver, lead, and copper mines have been discovered in the Kirghiz Steppe, near Bajanaul, but, for the lack of capital and communications, they remain almost entirely unworked. In the iron-furnaces of the Ural the product has increased in ten years. About 1870 it already amounted to 220,000,000 kilogrammes, or two thirds of the total product of Russia, valued at 50,000,000 rubles. The copper-mines of the Ural are exceedingly productive. The graphite mines of the Sayan mountains are becoming exhausted, and the most valuable deposits have already given out. The demand for this substance is greater since its employment for crucibles. Rich beds were discovered near the lower Yenisei, between 1859 and 1862. By the sea-route, discovered by Nordenskiöld, the product of the new mines, which has heretofore been transported by land through West Siberia to the mouth of the Petchora, can now be conveniently got to market. The product of Siberian furs of the more valuable sorts has greatly declined. The number of ermine-pelts offered at the annual fair at Irbit declined from 108,000 in 1850 to 56,000 in 1860, and 24,000 in 1870. Sable-pelts decreased in like proportion from 43,600 to 10,200 and 5,150. Squirrel-skins, on the other hand, increased from 3,490,000 in 1850 to 4,175,000 in 1870. The cause of the decline of the Russian fur-trade is supposed to be the imperfect manner of preparing and coloring the fur. The skins of Siberian water-fowl are exported in large numbers. Siberia has become the chief source of the ivory-supply. The tusks of the mammoth are twice as heavy as those of the African elephant. There have been exhumed altogether about 22,000 mammoth-skeletons. The carved and polished objects in diorite, porphyry, and other metal-colored stones, are manufactured at Kolivan in the Altai, and Ekaterinenburg in the Ural, where very low wages are paid, but their cost is greatly enhanced by the transport in sledges over the Ural mountains.

The rock-oil of the Caucasus has already be-

gun to compete with the American. In 1882 the new industry suffered from a crisis through overproduction. The quantity of naphtha produced in the Baku district during that year was 53,000,000 poods (1 pood = 36 pounds). There were shipped by sea 12,663,645 poods of petroleum, and 500,000 poods went by rail to Tiflis and Batoum. There were exported, besides naphtha, residuum to the extent of 17,842,946 poods, 1,267,580 poods of crude naphtha, 483,027 poods of lubricating oil, and 7,242 poods of benzine. In 1883 the yield of the wells reached an unprecedented figure, and a great quantity went to waste for lack of reservoirs. The producers, crippled by speculation, place their chief hope in the railroad recently begun between Baku and Tiflis, although the heavy grade rising to the Suram pass, 4,000 feet above the sea, precludes extensive shipments and low rates. The present mode of transportation is tedious and costly. The oil is loaded in vessels in the excellent harbor of Baku; but, within 120 miles of Astrakhan, it is transhipped to lighters, and again reloaded in the river-boats of the Volga at Astrakhan. The town of Baku, which before 1872 was only known as the place where the worshipers of the "eternal fire" assembled, has grown into an important place, although the country around is absolutely sterile, the water is saline and bitter, and the protracted heat of summer and the rude storms of winter render it unwholesome and uncomfortable.

Deposits of phosphorite, about a foot in depth, extend over 20,000 square versts in Smolensk, Orel, Kursk, Voroneje, Tambov, Penza, Nijni-Novgorod, and Simbirsk. The existence of this valuable manure has been known for twenty years, but it has only recently been exploited to satisfy a demand for export to England and other countries. It then came into use in Russia, and is found to have valuable qualities, especially in the cultivation of the beet-root.

Navigation.—The number of vessels entered at Russian ports in 1881 was 12,801, of which 7,859 were with cargoes; the total number cleared was 12,813, of which 10,442 were with cargoes. Among those entered there were 5,515 steamers, among those cleared 5,593. The number entered at the ports of the Baltic was 6,209; at southern ports, 4,973; at the White Sea ports, 763; at Caspian ports, 856. Of the total number entered, 2,822 carried the Russian flag, 2,509 the English, 1,883 the German, 1,483 the Swedish or Norwegian, 1,384 the Turkish, 881 the Greek, 586 the Danish, 691 the Austrian, and 576 the Dutch. The entries of coasting vessels numbered 46,604, of which 17,806 were of steamers.

The mercantile marine consisted in 1878 of 3,643 sailing-vessels, of 808,230 tons, and 259 steamers, of about 74,324 tons.

Railroads.—The total length of railways on the 1st of January, 1878, was reported as 20,417 versts, or 13,611 miles. The length on

January 1, 1883, is reported as 21,457 versts, or 14,304 miles. The aggregate capital of the railroads amounted in 1878 to 1,450,288,196 rubles, about two thirds in bonds and one third in stock. Over two thirds of the bonds are held by the Government, representing nearly one half of the whole railroad property of the country.

The project of a great Siberian railroad was declared most urgent by a special commission which sat in 1870. Seven lines are projected in the coal-fields of the Don to connect them with the Black Sea, the Sea of Azof, and the existing trunk lines. Their total length is 1,734 miles.

In 1880-'81 a military railroad was built from Michaelovsk, on the Caspian Sea, to Kizil-Arvat, and a tramway from that point to Beurma, near Bami, within 200 miles of Astrabad and 260 of Sarakhs, on the northwest frontier of Afghanistan. The Russian Government has long entertained the scheme of building a railroad through Central Asia, to compete with the sea-route for a part of the India traffic, as well as to develop the commerce of the countries it will traverse. The route from Orenburg *via* Tashkend, Samarcand, and Cabul to Peshawer, on the Indus, was given up, on account of the unproductive nature of the country, in favor of a line through the Caucasus. Gen. Anenkoff's project of a mixed land and water line with a ferry for railroad-trains across the Caspian, from Baku to Kizil-Arvat, was preferred to the route from Tiflis through Persia, passing through Tiflis, Tabreez, Teheran, and Candahar, and ending at Thikarpur, on the Indus. The length of the route chosen from Paris, *via* Warsaw, Moscow, Vladikavkas, Baku, Kizil-Arvat, Herat, and Candahar, to Shikarpur, is 8,000 kilometres; the time required for the journey sixteen, and eventually twelve days. The length of railroad to be constructed to connect the European with the Indian network by this route is only 2,000 kilometres. The line already constructed from Michaelovsk to Kizil-Arvat passes through the most difficult and inhospitable portion of the region. To extend the line to Astrabad, Sarakhs, and Cabul, or to Herat and Candahar, and join the Indian system of railroads, involves no question but that of the political susceptibilities of Great Britain.

Posts and Telegraphs.—The number of letters, newspapers, and parcels forwarded through the post-office in 1881 was 221,992,520 by the internal service, and 25,016,496 by the international service. The number of post-offices in 1881 was 4,521; of employés, 15,405.

The length of the state telegraph lines in 1881 was 56,340 miles; length of wires, 168,880 miles; the length of other lines, 4,855 miles; the number of domestic paid dispatches in 1881, 7,202,930; the number of international dispatches sent, 584,133; the receipts in 1881, 83,513,218 francs; expenditures for service, 15,059,333 francs; for maintenance and

materials, 9,619,528 francs; for the construction of new lines, 8,487,432 francs. The annual surplus of receipts is by imperial decree devoted to the extension of the lines.

The Army.—The military forces of the empire are divided into the active and the territorial armies. The active army is composed of the regular troops, recruited by annual conscription; the reserve, consisting of men on furlough, who are destined to complete the army on a war footing; the Cossack irregular cavalry; and troops made up of foreign elements. The territorial army is recruited from all the rest of the male population capable of bearing arms, between twenty and forty years of age. It is divided into two classes. The first comprises the men who have escaped the conscription after four drawings, and of those who have completed their time of service in the active army and its reserve. This class can be turned into the active army if the reserve is insufficient. The second class is to be called out solely for the defense of the country. Service in the regular army lasts six years, and in the reserve nine years. There is no immunity from service by substitution. Young men of a certain degree of education are accepted as volunteers at the age of sixteen or upward, and after a short service undergo an examination which releases them for service except in the reserve, or pass a higher examination as candidates for officers' commissions. The Cossack levies are regulated by special treaties. Many tribes of diminutive stature and unwarlike disposition are excused. An average levy of one in 250 males makes a force of about 100,000 men. The Don Cossacks and some of the other tribes, numbering from 600,000 to 700,000 souls, are all bound to render military service, and to furnish their own horses and equipments, and provision themselves while remaining within the borders of their own country. In return they are exempt from all taxes, and receive an annual tribute from the Emperor, paid to the tribe.

The strength of the regular army on the peace footing is 660,025 men, with 67,951 horses; on the war footing, 1,970,208 men, with 224,788 horses. The Cossacks number 51,946 men, with 88,707 horses, on the peace footing, and 145,325 men, with 138,036 horses, on the war footing. The other irregular troops number 5,776 men on the peace footing, and 6,331 on the war footing. Other bodies bring the peace effective of the active army up to about 770,000, and the war effective to 2,200,000 men. With the territorial militia the full strength of the military forces of the empire in time of war is about 3,000,000 men.

Fortification works, strategic railroad construction, and the massing of detached regiments on the German frontier, excited the suspicions of the Germans in 1883. A semicircle of six forts along the left bank of the river, seven kilometres from the city, was begun for the protection of Warsaw, which has hitherto

possessed no fortifications. Another line of four large forts is planned seven kilometres from Praga, the suburb on the right bank of the river. Ivangorod, on the Weichsel railway line, is to be fortified. Fortifications at Kovno on the river Niemen, and on the Königsberg and Wilna railroad, are in process of rapid construction. The irritation caused by stationing cavalry regiments in Poland led to their recall later in the year, in earnest of the pacific assurances of M. de Giers.

The Navy.—Russia maintains a fleet in the Baltic, one in the Black Sea, and smaller naval forces in the Caspian Sea, in the Sea of Aral, and in the waters of Siberia. The Baltic division comprised, in 1882, 27 ironclads, including the two under construction, carrying 282 guns; 33 other steamers, carrying 275 guns; 59 transports, 8 sail-ships, and 95 torpedo-vessels. The Black Sea division consisted of 4 ironclads, with 14 guns; 27 armed steamers, with 105 guns; 59 unarmed steamers, and 14 torpedo-vessels. The Caspian fleet comprised 12 armed and 4 unarmed steamers; the Aral fleet, 6 steamers, with 13 guns; the Siberian fleet, 8 armed steamers, with 42 guns; 13 other steamers, and 6 torpedo-vessels. The ironclad navy consists of 1 mastless double-turret vessel, the Peter the Great, with 14-inch armor and 4 40-ton guns of 12-inch calibre; 12 sea-going cruisers, plated with from 4½ to 7 inches of metal; 16 battery-ships and monitors for coast-defense; and 2 circular monitors of the type designed by Admiral Popoff. The crews are recruited by conscription, but partly by enlistment also. The period of service is nine years, seven active and two in the reserve.

Finances.—The Russian budget is modeled after the financial accounts of the French Empire. The revenues are classified as ordinary receipts, extraordinary receipts, and *recettes d'ordre*. The latter are the proceeds of certain sources of revenue, and are balanced by equal sums on the other side of the accounts. The extraordinary receipts consist principally of sums borrowed for the purpose of subsidizing railroads and for other works of general utility. There have occurred large annual deficits for more than half a century, occasioned partly by the construction of railroads, but mainly by war expenditures. The war expenditures for the four years 1876-'80 were 1,075,396,653 rubles. (The silver ruble is the legal unit of account, and is worth 78½ cents; the circulating medium is paper money, which is exchanged at a discount of from 10 to 20 per cent. and over.) The closed accounts for 1881 state the amount of the ordinary receipts as 651,754,009 rubles, and the ordinary expenditures as 732,413,150 rubles, supplemented by extraordinary military expenditures of the amount of 29,980,687 rubles; leaving a deficiency of 110,639,828 rubles. To cover this, the proceeds of various loans, to the amount of 112,679,027 rubles, were applied, leaving a balance in the treasury of 2,089,199 rubles. The

receipts in 1881 from the various sources were of the following amounts:

SOURCES OF REVENUE.		Rubles.
Land and poll taxes	114,469,000	
Trading licenses	92,466,000	
Liquor	294,389,000	
Tobacco	12,256,000	
Beet-root sugar	8,095,000	
Customs	84,628,000	
Stamps	14,969,000	
Registration	9,710,000	
Passports	8,237,000	
Navigation dues	1,727,000	
Quick-transit taxes	7,738,000	
Highways	171,000	
Miscellaneous imposts	5,852,000	
Mining royalties	865,000	
Mint	2,237,000	
Post-Office	14,184,000	
Telegraphs	8,239,000	
Railroads of the state	8,796,000	
Forests	14,498,000	
State mines	4,491,000	
Farmed domains	6,992,000	
Sales of domains	4,745,000	
Other state property	661,000	
Special funds	18,449,000	
Receipts applicable to railroad debt	15,632,000	
Repayments	8,748,000	
Revenue of Transcaucasia	8,597,000	
State institutions	1,836,000	
Sales	3,226,000	
Fines	2,102,000	
Temporary receipts	43,000	
Accidental receipts	18,856,000	
Budget d'ordre	24,969,000	
Total	651,754,000	

The expenditures in 1881 under the various heads were as follow:

EXPENDITURES.		Rubles.
Public debt	195,600,000	
Imperial Chancery	2,171,000	
Holy Synod	10,171,000	
Imperial household	10,842,000	
Foreign Affairs	4,211,000	
War	263,671,000	
Marine	32,188,000	
Finances	108,879,000	
Domains	19,837,000	
Interior	67,462,000	
Public Instruction	17,418,000	
Communications	12,168,000	
Justice	16,847,000	
Control	2,498,000	
Stud.	904,000	
Transcaucasia	8,641,000	
Total	762,898,000	

The budget for 1882 gives the total ordinary revenue as 656,717,870 rubles, the *recettes d'ordre* as 22,165,068 rubles, and the extraordinary receipts as 83,121,574 rubles; total, 762,004,512 rubles. The ordinary expenditures are set down as 658,595,151 rubles, the *dépenses d'ordre* as 22,165,068 rubles, the anticipated deficiency in the receipts as 8,500,000 rubles, and the extraordinary expenditures as 72,744,298 rubles; total, 762,004,512 rubles.

In the budget for 1883 the ordinary receipts are estimated at 707,578,007 rubles, the *recettes d'ordre* at 5,974,581, the extraordinary receipts at 62,457,835 rubles, and the balance in the treasury at 2,500,000 rubles; total, 778,505,423 rubles. The ordinary expenditures are estimated at 702,371,492 rubles, the *dépenses d'ordre* at 5,974,581, the extraordinary expenditures at 63,659,350 rubles, and the anticipated deficits in the receipts at 6,500,000; total, 778,505,423 rubles.

The public debt has accumulated since 1850. The loans were contracted in England, Holland, France, and Germany, and the proceeds applied partly to cover the annual deficits and partly in the construction of railroads. Before that year the interest-bearing debt was small, although large amounts of inconvertible paper currency were in forced circulation since the time of Catharine II. A loan of £6,400,000 was issued in 1850 for the railroad between St. Petersburg and Moscow; a loan of £12,000,000 sterling in 1859, one of £8,000,000 sterling in 1860, and a fourth for £15,000,000 sterling in 1862. These were followed by other foreign loans. Large sums were raised also by domestic loans. The total amount of the debt in September, 1878, was estimated to be 2,450,000,000 rubles, including two internal loans, called the Eastern loans, issued after the commencement of the Turkish War. The total amount on Jan. 1, 1882, was stated to be 8,051,180,190 rubles, including 545,042,630 rubles of paper notes. This sum did not include railroad bonds and the debt repayable by the peasantry for their lands, amounting together to 630,555,049 rubles. The amount of paper money in circulation was reported to be 716,515,125 rubles, of which 171,472,495 rubles were protected by a reserve. A new foreign loan of 50,000,000 rubles was raised in 1883.

One of the objects of the latest loans was to withdraw from circulation 50,000,000 paper rubles. On the ground that it would disturb commercial values, the Finance Minister reduced the sum to 30,000,000 rubles. By a ukase, dated Nov. 23, 1883, 30,000,000 rubles were devoted to railroad construction.

Finland.—The Constitution of the Grand Duchy of Finland was confirmed at the Diet of Borga, and by proclamations issued by each successive Emperor.

The Governor-General is General Count Heiden, appointed in June, 1881; the Minister for Finland, at St. Petersburg, is Baron T. Bruun.

The population on Dec. 31, 1880, was 2,081,612, of whom 1,019,187 were of the male and 1,062,425 of the female sex. In respect of religion it was divided into 2,040,535 Lutherans, 38,757 Greek Orthodox, and 2,820 Roman Catholics. The population of Helsingfors, the capital, was 44,584 in 1881.

The total foreign commerce in 1882 was in value 167,100,000 gold marks of imports and 119,800,000 marks of exports (the Finnish mark is equivalent to a franc, or 19 3/8 cents). The imports from Russia amounted to 71,700,000 marks, the exports to Russia to 54,600,000 marks; the imports from Germany to 42,600,000 marks, the exports to Germany to 8,300,000 marks; the imports from Great Britain to 15,900,000 marks, exports to Great Britain to 24,400,000; the imports from Sweden and Norway to 13,700,000 marks, exports to Sweden and Norway, 7,800,000. The United States received none of the exports, but furnished 2,200,000 marks of the imports.

The length of railroads in operation in 1882 was 732 miles, all except 20 miles the property of the state.

The number of letters transmitted through the post-office in 1881 was 6,249,932, of newspapers 7,790,439. The receipts were 687,400 marks; expenditures, 585,486 marks.

The revenue of the Government is set down in the budget for 1888 as 88,019,135 marks.

The public debt on the 1st of January, 1888, amounted to 70,085,739 marks, including a loan of 8,100,000 German marks issued in December, 1882, through the Bank of Finland and Rothschild & Son, of Frankfort, at 4 per cent. interest.

The Senate of the Grand Duchy of Finland has lately received the additional powers to make over land to purchasers who are not Finns, to establish all kinds of economical, scientific, and literary associations, to raise public buildings, to grant concessions for tramways, etc., and to reduce the customs tariff of the duchy. The central authority does not, however, give the Finnish state the right to issue passports to Finns for going abroad or to naturalize foreigners.

Coronation of the Emperor.—From the beginning of the year the approaching ceremony of the coronation engrossed the thoughts of official circles and of the general public, to the exclusion of all other subjects. It was a subject of anxiety to the loyal classes, among whom the feeling of gratification over the end of the anarchic interregnum, which would be signalized by the appearance of the Emperor duly crowned and anointed as the head of the nation, was tempered by dread of the threatened blow of the Nihilists. Such was the fear of regicidal plots, that the date of the ceremony was not publicly announced until a short time before the event. On New-Year's day the Emperor expressed the intention of assuming the imperial crown at an early date. In February he issued a proclamation announcing that the ceremony would take place in the month of May. He declared that he had postponed the rite so long because it was not a fitting time while feelings of grief and horror overwhelmed the hearts of his subjects, and that he had therefore determined to wait until the sentiments excited by the crime, of which his father, the benefactor of his people, fell a victim, had time to subside.

On April 11th the imperial regalia were carried in state from St. Petersburg to Moscow. The preparations in the Kremlin and cathedral and in the city of Moscow occupied several months. The festival was planned on a scale of unusual splendor and magnificence, but the most elaborate part of the preparations was the unwonted and ominous police precautions. Every nook and crevice was searched for explosives, the underground cavities and passages were explored, and every spot of earth sounded. Every person had a spy to watch his coming and going. Each gang of workmen was guarded by

an armed sentry. It was forbidden to use the windows and balconies in the streets through which the Emperor would pass, to view the procession. The owners and occupants were required to give guarantees that they would not let them out for the purpose, or admit any person into their houses.

The sum appropriated from the imperial treasury for the festivities was six millions and a half of rubles. The Moscow authorities also voted large sums for the purpose. Besides the gorgeous ceremonies of the coronation and the courtly entertainments, popular pageants were prepared and arrangements made for feasting a million people on the Khodynsky plain. The collection of booths and barracks and of theatres in which free exhibitions were given, erected there, resembled a city. Electric lights, arc and incandescent, were placed on the public buildings of Moscow, and so disposed as to bring out their architectural outlines in a grand illumination. More than 12,000 men from regiments whose loyalty was unquestioned were in the city, and 40,000 were encamped in the vicinity.

The Czar and Czarina left St. Petersburg on the 20th of May. Their formal entry into Moscow took place on the 22d. It was not until the middle of the month that the date of the coronation, May 27th, was officially announced. Every country was represented by some royal personage or dignitary of state: England by the Duke and Duchess of Edinburgh; Germany by Prince Albrecht Hohenzollern; Austria by the Archduke Carl Ludwig; Italy by Prince Amadeus; France by M. Waddington; Spain by the Duke of Montpensier; Denmark and Greece by Prince Waldemar and Queen Olga, brother and sister to the Czarina; and Norway and Sweden by Prince Charles. Prince Nicholas of Montenegro and Prince Alexander of Bulgaria were present in person. The Khan of Khiva came from that distant dependency, while the Ameer of Bokhara sent his son. The Shah of Persia was represented by his brother.

The official entry was a striking spectacle, from the great variety of races and costumes seen in the procession, a picture of the ethnic conglomeration which constitutes the empire of the White Czar. The Emperor, mounted on a white charger, was clothed in the sheepskin caftan and other features of the old Muscovite garb which he has revived in the uniform of his army. Ceremonious adorations at the various shrines of the Holy City characterized this pageant. The next day the imperial standard, which is renewed every successive reign, was consecrated. Then the Czar and Czarina retired to the Neskotchenaya summer palace, to pass the three days before the coronation in fasting and prayer. The approaching solemnity was proclaimed by heralds to the people. On the 26th devotional exercises were gone through in the Church of the Redeemer.

The ceremony of the coronation was performed on Sunday, the 27th of May, in the

Church of the Assumption, which could only accommodate the court and the state guests. The coronation, attended by long and complicated observances, was performed by the Czar himself, who received the crown from the Metropolitan of Novgorod, placed it on his head, and was anointed with holy oil by the bishop. After crowning the Czarina, the Czar entered the sanctuary and partook of the sacrament, in token of entering upon his functions as the head of the Russian Orthodox Church. The couple then displayed themselves in robes and crowns before the people. A mystical incident, which was prepared to work upon the superstition of the people, was the appearance of a white dove hovering over the Czar at the moment of the coronation.

The festivities which followed the coronation lasted a week. The spectacles provided for the people embraced the national drama, military pantomimes, fairy extravaganzas, and harlequinades, performed in four great open-air theatres, besides circus-feats and displays in an enormous hippodrome, and a great variety of minor shows. The mujiks assembled from many miles around. On the day of the popular *fête* there were nearly a million persons on the grounds. Baskets of meat-pies, cakes, and sweetmeats were distributed, and beer was served out without stint. About 400,000 people partook of the lavish feast. The two hundredth anniversary of the formation of the Preobrajensky Guard by Peter the Great was made the occasion of a grand feast, presided over by the Emperor, at which the two oldest regiments of the Russian army which composed the Guard, deputations from all the other regiments, and the select society of Moscow and the visiting guests were regaled in the village of Preobrajensk.

Although the glories of the coronation festival were designed to outshine if possible the display and munificence of former occasions of the kind, the essential character of the great national feast was lacking. The citizens of the loyal city and the faithful Muscovite peasantry were not wanting in devotion, but their enthusiasm was chilled by the precautions which were taken to prevent them from approaching the Czar. Wherever the imperial *cortège* passed a wide space was cleared by the military. The mujiks were forbidden to toss their caps in the air, lest they should contain bombs. Every one felt the restraint of the police regulations, which spread a gloom over the whole occasion. There was not the slightest attempt at riot or disturbance in Moscow. It was intended to have the return of the Czar to St. Petersburg celebrated by an illumination and popular festivities, but the plan was abandoned and all demonstrations interdicted. A report of the death of the German Emperor was fabricated, to excuse the omission of the projected state entry. A demonstration of disloyal sentiment occurred on the evening of the coronation, when an immense mob of workmen rushed

through the Nevsky Prospect and the principal streets. The disturbances were renewed the following day, when the police forbade illuminations and out-of-door festivities on the return of the Czar. The royal couple arrived secretly and returned to their seclusion in the Peterhof palace.

Foreign Policy.—The Russian Government was constrained by the firmness and strength of the European league, formed by Prince Bismarck to preserve the *status quo* and uphold the decisions of the Berlin Congress, to abandon any design it had of reopening the Eastern question. The prospect of a Russo-French alliance faded from the range of probabilities. In the Balkan lands the influence of the Austro-German alliance, at least among the governing circles, was supreme. The Muscovite war party in Russia, which stood nearest to Alexander III at the time of his accession, showed signs of activity and influence before the coronation, but after M. de Giers had tested the consistency of the peace league the chances of an aggressive policy disappeared. The journey of Minister de Giers to the European capitals was in itself an indication that the Czar refused to be ruled by his Panslavistic advisers, and desired to cultivate peaceful relations with the Central European powers. M. de Giers arrived in Vienna in the latter part of January, and also conferred with the German Chancellor at Varzin. An imperial message to M. de Giers after the coronation was designed to allay the distrust of European governments. "The great glory and power," he wrote, "which, thanks to Providence, have been acquired by Russia, the extent of her empire, and her numerous population, leave no room for any idea whatever of further conquests. My solicitude is exclusively devoted to the peaceable development of the country and its prosperity, to the preservation of its friendly relations with the powers on the basis of existing treaties, and to the maintenance of the dignity of the empire." In another circular the Czar expressed appreciation of the representation of foreign powers at the coronation as "fresh pledges of concord which agree with his own pacific intentions." The Panslavist party did not cease their efforts in the Balkan lands, but they met with no popular response. The question of the union of Eastern Roumelia with Bulgaria was agitated. Later in the year the Bulgarians themselves evinced impatience at the interference of Russia in their affairs, and administered a severe rebuff. Panslavistic agitations are awkward for the Russian Government, for domestic reasons, since the confirmation of the autocratic principle, because the Russian people in asking for political freedom are apt to cast up to the Czar and his Government the constitutions to which they have helped the Servians and the Bulgarians. The visits of King Carol of Roumania, King Milan of Servia, Prince Alexander of Bulgaria, as well as King George of Greece and King Alfonso of Spain, to Berlin

and Vienna were a counter-check to the Pan-slavistic agitations and warlike preparations in Russia. The only advantage in the Orient gained by Russia during the year was the recognition of her sovereignty over the Kilia branch of the Danube at the London Conference, which point was gained through the support afforded by the English Government.

Asiatic Expansion.—Checked on the European side, the Russians showed the more activity in Asia. The new commercial route across the Hyrcanian steppe from the Caspian to Kungrad, is still more important as a military route. The preoccupation of England with Egypt offered the opportunity for the annexation of the oasis of Merv, an act which was only delayed because the late British Government was prepared to make it a *casus belli*. The way was made smooth by the Merv Turkomans themselves, who were prompted to send a deputation to Gen. Tchernaieff, begging that a Russian governor be appointed over them, as the only way to put an end to constant quarrels between factions among the tribes.

Internal Politics.—The coronation was looked forward to by the upholders of the autocratic principle as a token of the resurgent power and glory of the czardom—a signal for a triumphant outburst of loyalty, temporarily eclipsed by revolutionary delusions. Not less disappointed than they were the party, composed of the bulk of the educated class, who long for the beginning of constitutional life in Russia. The most ominous and disturbing sign in the Nihilistic developments is the malicious satisfaction with which the majority of the middle and upper classes regard the acts of the terrorists. It was confidently expected that the Emperor would signalize the formal inauguration of his reign by proclaiming the liberties which his father had made up his mind to grant. Even in Moscow, the stronghold of autocracy, the Czar was greeted with an expression of the universal desire in the address of the mayor, Prof. Tchicherin, who boldly called upon him to admit the people to participation in the work of government. A manifesto was issued granting amnesty to criminals of various classes, but not to Nihilist convicts. Polish exiles who had not seen their homes for twenty years were given permission to return under police surveillance. Taxes which people were unable to pay were remitted. But in the manifesto there was no inkling or promise of a charter of political liberties. The peasantry, who have been encouraged to expect special favor and protection, were also grievously disappointed when the Czar, in answer to a deputation, declared that there would be no further derangement of the vested rights of property for the benefit of the peasant. The fate of the Kaasoff Commission, appointed to consider the question of local self-government and other important reforms, indicates the reluctance of Alexander III to inaugurate political reforms. Their re-

port was met by a reactionary project from Count Tolstoy, and then the whole subject was suffered to drop. One of the few progressive measures of the year was the introduction in the northwest provinces of the new judicial system, which has been in operation in the rest of Russia for twenty years.

The Russian press was shackled in 1888 as it never had been before. The papers were allowed to publish neither information nor comments on important events, several influential papers were suppressed, and others ceased their issues. Political thought and party life were thus crushed out to a great extent, and society was pervaded by dread, gloom, and uncertainty. The Liberal party, which is far more numerous than the Conservative, is divided into two sections. The more numerous one demands simply political freedom and the introduction of representative institutions. The other group, called Friends of the People, think that education and the improvement of the economical condition of the people should go before. The Conservatives are also divided. The bulk of the party follow Katkoff as their journalistic exponent, and have for political leaders Count Tolstoy, the Ministers of Instruction and Justice, and Procurator Pobodonostzeff, and thus control the policy of the Government. The other group is the Slavophile party, led by Aksakoff, which has a strong democratic tendency, and wishes to return to the conditions existing before Peter the Great, and extirpate European "civilization" and liberalism.

Agrarian Measures.—Many concluded from words uttered by the Czar at Moscow that the noble class would be taken into special favor, a policy advocated by the Minister of the Interior. Yet the predilection of the Czar for the peasant class was evinced by fresh enactments for their benefit. The fidelity of the peasantry is the surest prop of the autocracy, while the revolutionary and opposition parties are recruited exclusively from the nobility and other educated classes. The redemption payments which have weighed down the liberated peasants since the abolition of serfage were reduced. The poll-tax was partially removed. Another measure intended for the improvement of their circumstances was the creation of a state land-bank.

Commercial Policy.—Schemes of ambition or improvement are a necessity to the enthusiastic and visionary Russian mind. Since the extension of Russian influence and power to the southwest was effectually resisted by the German powers, attention was directed to expansion in Asia, to which the present English Government opposes no decided objections. The extension of Russian manufactures is a correlative of Asiatic conquest. The Government was the more inclined to favor the idea of encouraging industry and commerce, because the promises held out to the peasantry of im-

proving their condition were doomed to disappointment. The merchants and manufacturers were called upon to contribute heavily to the hopeless attempt to lift up the agricultural class to a satisfactory economical condition. To take the place of the remitted arrears of taxes and the abolished poll-tax, an impost of 8 per cent. on the net income of all commercial concerns was proposed, whereas hitherto the only special tax resting upon them was the annual fee for their guild papers, or trading license. This proposition, coming at the time of a commercial crisis, caused partly by the depreciation of the paper rouble, prompted the mercantile class to demand that a separate Ministry of Commerce and Manufactures be created, to look after their interests, instead of trusting them to the Minister of Finance, whose chief concern is to fill the coffers of the state. They had a candidate ready in Gen. Ignatieff, who, when Minister of the Interior, set on foot the movement for the encouragement of the national industries. Under his protection members of the Panalavist party started an association for the advancement of national labor and industry, with local councils all over the country, sending delegates to a general council, which assembled in the capital. After his retirement from office, Count Ignatieff was elected president of this industrial association. A fever of commercial enterprise has prevailed for a year or two past. The merchants and manufacturers of Moscow have insisted on the recognition of the destiny of Russia as a manufacturing country. A great industrial exhibition was held at Moscow in 1882, followed by a series of exhibitions in many other places. While American and Indian competition is likely to deprive Russia of her importance as the granary of Europe, the young industries of Moscow and Central Russia are capable of indefinite expansion, because with the Volga and Caspian route they possess the key to the trade of all Central Asia. The first stimulus to industrial production on a large scale was given when English manufactures began to be imported into Persia through India. Moscow, where the capital and the intelligence existed, became the manufacturing center. The Russians have traded with the Asiatics for centuries, and consequently best understand how to suit their requirements, besides possessing the readiest means of access and political control and preponderance. For these reasons a renewal of Russian activity in Asia suggests the development of the manufacturing interests. The new German tariff, and more recently the prohibition of the export of Russian raw spirits through Germany to Spain, which Prince Bismarck inserted in the new Hispano-German commercial treaty, impelled the industrialists to call for fresh protective and retaliatory measures. But the Russian tariff is already so highly protective that the Government could find hardly any article on

which the duty could be increased, to suit the various clamoring interests, without hindering other industries by enhancing the cost of materials or implements. A duty on coal was no sooner imposed, than it was found to act in this way, and was again removed. While attention was directed to the East as the proper field for Russian trade, the notion of ousting the Austrians from the Bulgarian market was entertained, although Austrian trade there is more than twelve times greater than that of Russia. A lower tariff for Russian products entering Bulgaria, and other privileges were obtained. A line of steamers was started by Prince Gagarine to ply between the Black Sea and Bulgarian ports on the Danube. Political motives and military concomitants are frequently connected with Russian commercial schemes. This steamship company, which is subsidized by the Government, has permission to take its officers and physicians from the imperial navy. A volunteer fleet of cruisers has lately been established, which in time of peace are to carry on trade between the Black Sea and the ports of the Orient.

The way in which the Russian Government can best further the commerce between Central Russia and Asia is by improving the means of communication. The withdrawal in 1868 of the right of free transit across the Caucasus, will have the effect of excluding some foreign goods from Persia, but it was scarcely needed, since Russian products command the market. The extent and importance of the Russian trade are little known. The transactions at the annual fair of Nijni-Novgorod have declined since the development of Russian manufacturing industry. While the average number of annual visitors since 1869 was 250,000, the number in 1882 was only 180,000. The fair of 1883 was particularly unsatisfactory. Gen. Tohernaieff, the Governor-General of Turkistan, has established a new trade route to Turkistan, Bokhara, and Khiva. Two principal caravan routes have heretofore been used to communicate with Russian Central Asia and the khanates. The eastern route, 2,700 miles long, starts at Ekaterinenburg, traverses southwest Siberia to Omsk, follows in a southeast direction the right bank of the Irtysh to Semipalatinsk, and thence by a long bend reaches Chemkent, lying directly southwest. The western and more frequented route, though more difficult and dangerous from robbers, goes from Orenburg through Orsk to Kazalinsk on the Syr Daria, and follows the right bank to Chemkent and Taahkend. The journey requires about 112 days. The new route is only 800 miles long, and will take not more than 83 days. It starts at the Mertvi, or Dead Bay, on the Caspian, opposite Astrakhan, and crosses the Ust Yurt Steppe to Kungrad, at the delta of the Oxus, whence the journey is made by water to Charjui or Ilohig. The route across the plateau has the advantage over the Orenburg route of a firm soil,

which permits of wagon transport, without the tramway projected by Gen. Tchernaieff, and that of abundant and succulent grass at certain seasons, but the disadvantage of precarious wells of brackish water. This does not apply to the last third of the road, which passes through a part of the oasis of Khiva. One of the causes which led to a search for a direct route to Central Asia, was the improvement of steam navigation on the Caspian Sea. Formerly navigation was retarded by the want of coal, but an excellent fuel has been found in the refuse of petroleum-refineries.

Religious Legislation.—A relaxation of the decrees against the Raskolniki, or sectaries, contrasts with the general reactionary tendency of the Emperor's policy. He has need of the good-will of this great class, powerful in wealth, intelligence, and numbers, which has flourished under persecution. While numbers of Old Believers have embraced the Orthodox creed, the partly or wholly rationalistic sects have gained thousands of recruits annually among the peasantry. The present number of dissenters is estimated at 12,000,000. The official estimates divide them into 8,000,000 with priests, 8,000,000 without priests, about 1,000,000 Spiritual Christians, and 65,000 enthusiasts. The latter category, comprising the Ohlisti, or flagellants, the Skopze, or eunuch sect, etc., is on the decline. The "heretics" possess a rich literature. Education among them is almost universal. The tendency of the priestless sects is toward rationalism and indifference in religious belief. This makes them cling the more earnestly to the principle of intellectual liberty and the ideas of the ancient Slav democracy, corrupted through Tartar rule and aristocratic institutions imported from Europe. They constitute, therefore, a power in the state which can not be won over to the support of the existing order, and which has many points of contact with Nihilism. The Mennonites, who refuse to perform military service, are forced to emigrate. The Khan of Bokhara has declined to allow them to settle in his territory. Small colonies went to China and other parts of Asia during the year.

Of a progressive nature also were measures taken to conciliate the Poles, especially the arrangement of a *modus vivendi* with the Vatican. The terms of a convention were settled with the Curia in the early part of 1888. The subject was first broached in 1880 by M. d'Oubril, then ambassador at Vienna, who discussed it with Cardinal Jacobini, Papal nuncio to that court. The negotiations were continued by M. Mossoloff, Director of Foreign Affairs, but were interrupted in consequence of the murder of the Ozar. The Russian Government expressed a desire to terminate the period of ecclesiastical pressure by a practical arrangement, without going into questions of principle. The details were arranged by M. Mossoloff and M. de Giers at the Vatican. The exiled Bishops of Wilna and Jitomir and the

Archbishop of Warsaw were pardoned. The vacant sees were filled, the seminaries placed under the control of the bishops, sermons and pastorals were exempted from censorship, and the rights of the bishops enlarged in other respects. In return, the Vatican promised to bind the clergy to a loyal demeanor, to secure the state interests of Russia, and to have Russian taught in the seminaries. The language of the pulpit is to be that of the majority of the parishioners. A Polish Catholic, Gen. Gurko, was appointed Governor-General of Poland.

Russification of the German Provinces.—The confirmation of the autocratic system, and the adoption of a stationary internal policy, contributed not less than the anti-Russian political combinations of Prince Bismarck to the eclipse of Russian influence and the Pan-Slavistic idea among the South Slavs, and left the Balkan Peninsula open to the intellectual activity and commercial facilities of the Germans. Within the confines of the Russian Empire under Alexander III, Muscovite ideas have every chance of prevailing in the conflict between Teutonic and Slav civilization. German placemen, of the class which since Peter the Great has battened in the public service, and with arrogant pride developed an oppressive and alien method of government, have made way for Russians who understand the people and can talk to them in their own language. The Russification of the Baltic provinces presents practical problems which are difficult of solution. The autonomous institutions of this German corner of Russia work well, and disclosed few abuses to the commission appointed to examine into them. The agrarian question is a still more delicate one. Any measure to relieve the Esth and Lett peasantry from their economical subjugation would be a weapon in the hands of the Socialists. The agitation in Livonia, Esthonia, and Courland continued through 1888, and in some places degenerated into agrarian murder and arson. One symptom of the movement is the wholesale conversion of the peasantry from the Lutheran to the Greek Catholic confession. The course of the Government authorities would be simpler if the disaffected people were Muscovites, but they hesitate to aid and countenance the national Ruthenian movement, which was formerly rigorously suppressed with the assistance of the German barons. Here, as in Austria, the conflict of nationalities takes the form of a battle of languages. The Little Russian language is a pure Slavic idiom, while the Muscovite dialect, which has been imposed by the power of the autocracy upon the Western Slavs, is the product resulting from the imposition in former centuries of the Russian language upon the Finno-Tartar population of Great Russia.*

* Nestor, who wrote in the eleventh century, distinguishes the Turanian race, which inhabited Muscovy, from the Aryan people of Kiev. Olearius, a German traveler, who wrote in the latter part of the seventeenth century, says the inhabitants of the eastern part of the land of Moscow spoke Finnish. The Abbé Chappe found the same radical difference

In 1859 permission for the literary use of Little Russian was granted. A luxuriant growth of literature in the ancient tongue and an enthusiastic revival of philological studies resulted. This movement was hemmed, but not checked, by the recall of the permission in 1876. The idiom, banished from the church, the school, the theatre, and the book-shop, and persecuted in the land of its origin, took refuge in the eastern districts of the Austrian province of Galicia. Among the Ruthenians of Galicia the Russians set agencies to work to encourage the national sentiment which they endeavor to crush out in Esthonia and Livonia.

Educational Measures.—The reform of university education is under consideration. The indications are that the changes will be reactionary. It is proposed to reintroduce bodily punishment in the gymnasia. An order of Delyanoff, issued in 1882, allows students to be transferred from one university to another at the discretion of the curators. The ecclesiastical censorship over scientific books has ceased, and the jurisdiction of the censors is confined to political works. The universities gave the authorities much trouble in the spring. First occurred an outbreak of the students at Nova Alexandria, on the Polish border, resulting in the closing of the college and the expulsion of 143 students. Subsequently the students at Kazan revolted against the university authorities, and then those at St. Petersburg.

Nihilism.—Numerous arrests, made under the administration of Count Tolstoy, reduced the number of daring and desperate conspirators. The coronation passed off without any terroristic act, though various plots were frustrated by the police, to whose vigilance it was due that, for a long time after, no political crime occurred. Yet the issue of proclamations from the secret press showed the vitality of the revolutionary party, and by many evidences, kept from the knowledge of the public as far as possible, the Government perceived that it was not less numerous or dangerous than before. Arrests were made in great numbers, particularly among the students. The old prefecture of police was re-established. The Holy League, formed to combat the Nihilists by means of their own system of secret organization, was not approved of by the Government, and accomplished no results of importance. In April a great Nihilist trial took place at St. Petersburg. Bogdanovich, who was accused

of laying the mine under the Little Garden street, made a noteworthy declaration of the aims and principles of the Party of Terror, which were not to overthrow all authority, but to establish a just system of administration. The seventeen prisoners belonged to all ranks of society, from the peasantry to the nobility. All but one were convicted, and six of them sentenced to death, including Bogdanovich, Telahoff, who was implicated in the attempt to blow up the imperial train at Alexandroffsky in 1879, and Gracheffsky, who was charged with being one of the assassins of Alexander II. Soon after the trial a number of officers of the army were said to have been arrested. At the very end of the year, Lieut.-Col. Sudeikin, of the St. Petersburg gendarmerie, the most efficient officer engaged in the detective work against the Nihilists, was murdered by subordinates, who enticed him into an empty building, on the pretext of arresting a female Nihilist. The perpetrator was Degajeff, *alias* Jablonsky, formerly a captain on the artillery staff, who was known to have been a member of the revolutionary party, and was employed by Sudeikin as a spy.

Anti-Semitic Disturbances.—Spasmodic outbreaks of anti-Jewish feeling occurred during the year, and serious disturbances in Ekaterinoslav, the district of Southern Russia which is most notorious for such excesses. In May occurred anti-Semitic disturbances in Rostov, where one hundred and thirty houses were wrecked by rioters, fifteen of whom were shot down by the police. In July the Jewish burial-ground at Ostrog was violated and the attendants murdered. In August grievous excesses were committed in Ekaterinoslav. They began on the 2d with the destruction of the shop of a Jewish merchant who struck a peasant-woman. The riot then took the usual course. The mob broke into one house after another, and with knives and hammers demolished everything. The Jews who did not escape in time to the woods were beaten and maltreated. Some of them died of their injuries. The military arrived immediately and fired into the mob, killing fourteen and wounding twenty-eight, but without stopping the work of demolition. This disturbance in Ekaterinoslav was characterized by a new and portentous feature. The Jews were not the only objects of the rage of the mob, but the houses of Christians were attacked as well, indicating the prevalence of communistic sentiments, and the dangerous discontent caused by the economic distress which exists in many parts of Russia, particularly in the south. In November a riot, in which Jewish dram-shops and houses, and houses of Christians as well, were plundered, broke out in Krivorog, a town in the government of Ekaterinoslav.

A Jewish commission, presided over by Count Pahlen, formerly Minister of Justice, proposed in their report methods for abating the evil practices to which the Jews are ad-

between the Slavs and the Muscovites in the middle of the eighteenth century. The process of Slavification is still going on in the eastern governments, where Finnish, with only an admixture of Slavic words, is spoken; while, in the western and northern parts of the same region, the lower classes still speak a compound language. The number of Slavified Tartars in European Russia is estimated at 40,000,000, against only 15,000,000 pure Russo-Slavs. After the time of Peter the Great, the Government began to conceal and deny the Asiatic origin of the Great Russians. A protest of Osharine the Great provoked the remark of Mirabeau that "the Russians are Europeans only by virtue of a declaratory definition of their sovereign."

dicted. Chief of these are smuggling at the German and Austrian frontiers, and the abuses connected with the liquor-traffic. They are accused of seducing the peasantry to drink, and getting away their earnings. A third

complaint is the avoidance of military service. The greater portion of Jewish conscripts are detailed as musicians or attached to the departments. Extremely few distinguish themselves by bravery, or rise to the grade of officer.

S

SALVADOR, a republic of Central America. Area, 18,720 square kilometres; population, 954,785. The President is Dr. R. Zaldivar y Lazo (elected in May, 1876). The Cabinet is composed of the following ministers: Foreign Affairs and Justice, Señor S. Gallegos; War and Finance, P. Melendez; Public Instruction, D. Lopez. The President of the Senate was J. Moreno, and of the Chamber of Deputies, J. Avila. Capital, San Salvador.

Finance.—The revenue in 1881 was \$3,952,000; the outlay, \$3,827,000.

In the budget for 1882 the revenue and expenditure were estimated as follow:

INCOME.	
From customs	\$1,847,000
Spirit and powder monopolies	988,000
Stamp-tax	78,000
Post-Office and telegraphs	82,000
Sundry items of revenue	1,012,000
Total	\$3,952,000
OUTLAY.	
Civil-List of President	\$15,000
Assembly	26,000
Foreign Department	40,000
Department of Justice	92,000
" the Interior	55,000
" Public Instruction	152,000
" Finance and War	113,000
Army	900,000
Public Works	265,000
Public debt	352,000
Subsidy to Pacific Mail steamers	65,000
Post-Office and telegraphs	88,000
Customs	25,000
Tax collection (monopolies)	828,000
Other expenditure	1,807,000
Total	\$3,827,000

The national debt amounted, on Oct. 1, 1881, to \$566,505; the floating debt, \$1,668,124.

Railroads.—The first line of railway, between Acajutla and Sonsonate, went into operation in July, 1882; the line between Sonsonate and Santa Ana (La Libertad, the port) is being built. Engineers are surveying the line for the railroad from La Libertad to San Salvador, which is about to be constructed by English capitalists under a concession from the state.

Telegraphs.—There were in operation, in 1881, about 2,100 miles of wire, the service being carried on in 48 offices. Number of telegrams sent in the same year, 138,869; 83,894 were private dispatches and 54,975 Government.

Commerce.—There entered the ports of Salvador, in 1881, altogether 384 vessels, of an aggregate tonnage of 413,988, 245 being steamers, including eleven men-of-war.

The imports in 1881 were valued at \$2,705,410, the exports at \$4,902,436.

The most important articles of export in 1881 were coffee, 1,940,000 pounds, worth \$2,909,-

200; indigo, 1,470,000 pounds, worth \$1,470,200; bar silver, \$105,440; sugar, 3,493,000 pounds, worth \$104,800; specie, \$55,634; Peruvian balsam, hides and skins, etc.

By decree of Sept. 21, 1883, the Government of Salvador, desirous of stimulating foreign trade, decided that, dating from October 1st in the same year, the import duty on all goods should be reduced 10 per cent., and that, dating from Jan. 1, 1884, a further duty reduction of 10 per cent. should be made.

SALVATION ARMY, a religious band, claiming to be converted men and women, who are organized somewhat in military fashion; their purpose being to make all men listen to the claims which God has upon their time and service, and compel them to yield him his due. The Army was originated in London, England, in the year 1865, by the Rev. William Booth, its present general-in-chief. He was brought up in the Church of England, converted among the Methodists, and afterward became a traveling preacher among them, and labored as such till 1861, when he gave himself up, with his wife (who is the author of several works), to evangelistic work. They were eminently successful, and thousands were added to the churches. In 1865 Mr. Booth was led to the east of London, where the ignorance and vice were appalling, and here he gave himself to the work of making these people hear and know of God and salvation. The Salvation Army is the result. He set out with the purpose of getting his apostles of salvation out of the gin-mills. How far he has succeeded, this wonderful Army is his witness.

The present name was adopted when, after eleven years of deliverance to captive sinners, it was found that it was virtually an army of salvation, since which epoch it has made its most rapid advances. It has made greater progress than any other religious movement since the Lutheran reformation. It numbers 500 corps in Great Britain and Ireland, and reaches millions of people by its out-door marches and meetings. It has divisions and divisional headquarters in Sweden, Switzerland, France, Germany, Africa, India, Australia, New Zealand, Tasmania, and the United States. Sixteen weekly papers, each known as "The War-Cry," are published in these different countries. Their aggregate circulation is 26,000,000 copies a year.

The movement reached America in 1880. Commissioner Roilton and seven Hallelujah lasses were the first contingent. After a time Roilton was recalled, and Major Thomas E.

Moore was sent out to take command. After severe fighting and persistent efforts, it mustered five corps and eleven officers in 1882. Since then its prospects have brightened continually. At present there are 75 corps and 160 officers. Of these, only eleven are English; the rest are the product of the soil. It is operating in more than thirty towns and cities of the Dominion of Canada, and in the chief cities of fourteen States of the Union. This does not include California, which is a separate command. The American headquarters are at the Lyceum, Washington Street, Brooklyn, N. Y. Major Moore is on the wing most of his time, in Canada and the States, visiting the various corps, dedicating barracks, presenting colors, and directing affairs generally, besides writing for the "War-Cry."

It appears from their official organ that the Army have been subjected to more arrests and imprisonments in this country than in all other countries together. The charge on the police record is "disorderly conduct," for marching in the streets. Yet they are defiant in prosecutions, claiming that "God has a right to the streets." The first necessity with them is, to attract attention; it is necessary to awaken the people, in order to rescue them. This is the only explanation necessary as to the processions, carrying of colors, and beating of drums.

The uniform consists of military tunic and trousers of navy blue, sparingly trimmed with red braid, and marked with the letter S on the collar. Their head-gear consists of a military helmet with flaming frontal piece bearing the words: "Blood and fire! Prepare to meet thy God! S. A." The women wear a neat skirt and bodice of the same color and trimming, with a "poke" bonnet encircled with a red band bearing in gilt the inscription, "The Salvation Army."

They believe they are acting in accordance with the mind of the Spirit in utilizing the services of female speakers; that as the devil has freely used this instrumentality for the demoralizing of men, they are at liberty to employ the same agency for the recovery of men. As a matter of fact, they find the female agency the most effective, especially among rough men. Sin and Satan, death and hell, are as real to them as "the enemy" is to the men who fight with carnal weapons; so also are the possibilities of victory. Their uniform makes them realize this everywhere they go; it attracts attention, and serves as a safeguard against worldly conformity.

The usual military titles—general, colonel, major, captain, etc.—are conferred on the officers of various grades. When asked the reason of this, they reply: "Because we find them ready made to our hand, they harmonize with our organization, and readily convey to the minds of the common people the rank of the officer; and because they are considered to be less objectionable to the mass of the people than those used to describe church officers."

The Salvation Army has a regular system of government, and from one central head its authority reaches through the varied grades of office, controlling and directing all. It is at once the most aggressive and the most successful missionary organization in the world.

The Army has no political character or aims. It teaches obedience to the laws, and respect for their administrators. Its great business is to bring men to God, that is, to all that is good and virtuous. It is an uncompromising enemy of tobacco and strong drink, and every form of ruinous self-indulgence.

As its object is to conquer sin, and not to capture the righteous, it openly avows its objection to receiving church-members into its ranks. It prefers the uncared-for; hence it seeks to operate more especially upon the great mass of indifference found among Catholics and Protestants alike. It seeks after souls abandoned by others, those whom the isolated forces of religion have not reached, adapting its invitations and means to meet their tastes, and attract them to its meetings.

"The Salvation Army," says a writer in the "Barry Gazette," "strives to be temperance society, church, Sisters of Charity, civilizer, and Christianizer, all in one. By its 'knee-drill,' 'sharp-shooting,' 'sword-exercise,' and 'heavy-artillery meetings'—as they are pleased to call them—it has conquered the enemy on all sides, and brought many valiant soldiers into the service of the Great Captain. The meetings have been crowded for months, and more than rival the run of the best plays. Many who at first go out of curiosity, are afterward drawn by the power of the Spirit; and many who go to scoff, remain to pray. Already a great improvement is noticeable in the lower classes, in increased industry, better apparel, and more orderly conduct."

Their methods, though contrary to the general usage of religious denominations, are simple, plain, direct, and unique; yet none the less, they believe, in accordance with Scriptural teachings. Their posters, placards, and other advertisements are studiously made as far as possible from anything like the usual religious announcements. While they may offend refined taste and the religious prejudices of cultured people, they attract the very class they want to reach—gamblers, drunkards, harlots, thieves, and neglecters of God generally. They study the law of adaptation. A few headings from "The War-Cry" will serve to show the class of people they address: "The Boy and the Broom-stick," "The Last Black Eye," "Salvation in the Sawdust," "A Wakefield Jail-Bird to the Front."

They frequently occupy old and dilapidated buildings, and sometimes the best that a town affords; but such places as the old jam-factory in a populous neighborhood suit them better. A place of this description was taken in a city, and the public were invited to "come and get real jam, and see Jesus." They could taste be-

fore buying, and buy without money and without price. They name their buildings Salvation barracks, store, factory, or warehouse, as the case may be—anything to avoid the prejudice that is supposed to exist in the minds of the common people against churches and religion generally. By adding the head "Salvation," they describe the nature and object of the meetings held there.

They parade the streets with banner and music. Their songs of praise, instruments of music, and distinct uniform, attract the crowd wherever they go. By this means many are induced to enter their "barracks" who for years have never entered a church, and seldom, if ever, listen to the word of God. They recognize the philosophy of making the people feel at home. Formality and stiffness must be got rid of, and the services rendered homely, varied, and bright. They do not adhere to any particular routine or form of service; but, as a general rule, the leader announces a hymn, and reads and expounds it verse by verse in the order of singing. The singing is of the heartiest description. The tunes are mostly old Methodist tunes; but even worldly airs do not come amiss to them. Many of their songs have lively and inspiring choruses and refrains, which easily impress themselves on the popular mind. The chorus, with the Salvation Army, is the principal part of the singing. It is repeated over and over again, sometimes with striking variations. The soldiers are massed upon the platform facing the audience, and beat time on their drums and tambourines. While singing the last stanza, they drop on their knees. Their prayers are invariably short, and are characterized by an apparent free-and-easiness which seems to border on undue familiarity. But they never for a moment lay aside their consciousness that they are in the immediate presence of God. After about three prayers, interspersed with snatches of song, they rise from their knees. Then follows a Bible-lesson, and sometimes a brief comment. Their creed is extremely simple; it is just that which is deemed essential to salvation by all orthodox churches. They say to their hearers: "You are serving either God or the devil. It is infinitely blessed to serve God, and eternally disastrous to serve Satan." And on this statement they base their appeal for an instant decision to renounce the evil and choose the good; at the same time they declare that Christ is present, ready to save every one who feels he is a sinner and desires to be saved.

Their public speaking is singularly destitute of the controversial element. There is no theological discussion, no expounding of doctrines. They never argue or dispute. They attack no system of religion. There is nothing that can possibly stir up resentment in any person of another faith. At the close of a meeting, sinners are urged to come forward for prayer.

They live and move in the revival spirit all the year round. As a preaching medium they

use the experiences of their converts, on the principle that the class they seek to rescue can best be influenced by members of the same class. They teach their converts that they are responsible for the salvation of others, and exhort them to put forth continuous and daily efforts to this end.

Contributions are received at the services of the various stations, and the converts are taught that they must contribute to the support of the work. Local treasurers have charge of the finances, and present balance-sheets to their corps, and all accounts are inspected by the staff. The officers have no salary guaranteed, but are instructed to trust in God for their support. Every station makes a weekly return of its receipts and expenditures, attendances and converts, so that the material and spiritual state of the force may always be seen at a glance. After the expenses of the corps are met—such as rent of hall and gas, officers' support, etc.—the remainder, if any, is sent to the "war-chest," at headquarters, to become the "sinews of war" for prosecuting the work in other fields. General Booth receives nothing out of the Army funds, being sustained from an independent source.

Major Moore says: "In this our America, after three years of severe toil and suffering, the work has taken a deep hold, notwithstanding many unexpected difficulties. It is confidently expected to extend its efforts to every State of the Union, and never retreat till the judgment-day. It is only a question of time requisite to train officers for the work, and every city in the United States will have its corps of the Salvation Army, and the question of how to reach the masses will have been settled by reaching them."

SANTO DOMINGO, a republic occupying the eastern portion of the West Indian island of that name, the western portion being Hayti, which see.

Area and Population.—The area of the republic of Santo Domingo is 17,827 square miles. The population was estimated in 1880 at 800,000, but it has since then been considerably on the increase, a strong current of immigration having set in from neighboring islands, and many settlers and planters arrived from the United States. The republic is divided into five provinces and four maritime districts. The capital city is Santo Domingo.

Government.—The President is Gen. Ulysses Heureaux, and the Vice-President Gen. Casimiro N. Moya. The Cabinet in 1888 was composed of the following ministers: Interior, W. Figueredo; Foreign Affairs, S. Imbert; Justice, Public Works, and Instruction, T. Mejia; Finance and Commerce, E. G. Marchana; and War and Navy, A. Woz y Gil. The United States Consul at the city of Santo Domingo is Mr. H. C. C. Astwood, and the Dominican Consul-General, for the Union, at New York, is Mr. J. Delmonte; the Consul at New York, Mr. H. Billini; and at Boston, Mr. E. M. Fowle.

Finance.—The budget for 1882 estimated the income at \$1,500,000, and the outlay at the same figure.

In 1869 the Government had contracted a 6 per cent. loan in London to the amount of £757,000, at 70 per cent., but it has been officially proved that it never received more than £32,000; hence in 1872 it repudiated the loan, and has since stopped paying interest on it. The home indebtedness is \$2,000,000, and to pay it off a sinking fund has been created by means of 15 per cent. set aside annually from import duties collected.

The Government had decreed in 1883 the levying of an import duty of 12 per cent. on Mexican silver coin, and prohibited the introduction of old and mutilated coin; but as this law created a scarcity leading to great inconvenience, it had to be abrogated. It is now proposed to coin \$4,000,000 silver, of the same standard and weight as the legal silver circulation in the United States. A National Bank has been founded in the city of Santo Domingo, by authority of Congress, under the patronage of the Government.

Commercial Facilities.—Early in May, Congress passed a bill creating San Lorenzo a free port. This port is to be divided into two zones, the one free, for "in transitu" goods, and the other for importation. This measure has in view the increase of trade that is expected to result from the completion of the Panama Canal, the bay of Samaná being conceded to be the finest in the West Indies, and very convenient as a port of call and repair on the route to Panama from Europe.

The Government has granted a subsidy of \$500,000 to a French company, which engages to improve the navigation of Oyama river.

A port rapidly rising in importance, where great activity is being displayed in the way of public and private improvements, is San Pedro de Macoris, where the Clyde American steamers call and take cargo, principally sugar. Railroads are to connect the sugar region with San Pedro, and a concession to that effect has been granted to Don Juan Serrallés.

The construction of the Samaná Railroad was pushed with vigor in 1883.

The Government made arrangements in 1883, with Baron Almeda and an English telegraph company, not only to have a cable laid connecting with the one between the West Indies and the rest of the world now in operation, but land-lines all over the republic.

Education.—There were in 1883, in the city of Santo Domingo, two colleges; twenty-one schools of various grades; a professional institute where civil and commercial rights, political economy, medicine, mathematics, etc., are taught; a school for teaching natural history, chemistry, botany, etc., and a Municipal Institute, where the higher branches of education can be obtained.

Exhibitions.—A National Exhibition is to open in the city of Santo Domingo in August, 1884.

The Government was informed in 1883 that Baron Almeda and M. Collin de Parade had carried out the project of permanently exhibiting in the French capital specimens of the agricultural and mineral products.

Sugar.—Sugar belonging to estates that suffered from the hurricane of September 6th will for six months pay only half the export duty. Sugar estates in the districts of San Cristobal, Monte Grande, near San Pedro de Macoris, and the city of Santo Domingo, were in a most flourishing condition in 1883, and the sugar industry was evidently on the eve of a remarkable development. American capital has also been extensively invested in this industry. The machinery is imported from the United States. Portable railways for the conveyance of cane and sugar were being generally adopted by the estates.

Coasting Steamers.—Messrs. Mayans & Co., bankers in the city of Santo Domingo, have secured the privilege of establishing a line of steamers for service between the ports of Barahona, Tortuguero de Azua, San Pedro de Macoris, Samaná, Puerto Plata, and Monte-Cristi.

Commerce.—Importations into the ports of Santo Domingo and Puerto Plata in 1879 amounted, jointly, to \$1,179,849, and the exports to \$978,066. Since then the commercial movement has expanded very much, the increase of traffic being notably through the ports of Samaná, Azua, and Monte-Cristi. The principal export articles are sugar, tobacco, coffee, honey, wax, mahogany, other cabinet, and especially dye-woods. Guano exportation had very nearly ceased altogether, but had also revived.

In 1881 the exports and imports were:

PORTS.	Imports.	Exports.
Through Santo Domingo.	\$765,271	\$687,261
Through Puerto Plata...	752,851	636,763
Through Azua, Monte-Cristi, and Samaná....	243,194	817,052
Total.....	\$1,761,216	\$1,601,075

The American trade with St. Domingo has been as follows:

YEARS.	Imports from into the United States.	Exports of domestic merchandise from the United States.
1880.....	\$650,498	\$930,501
1881.....	924,731	757,590
1882.....	903,080	904,149
1883.....	1,417,519	1,179,300

The chief articles imported into the United States in 1883 were sugar, 27,281,049 pounds; and molasses, 448,587 gallons.

The number of vessels that entered the port of Santo Domingo in 1881 was 169; aggregate tonnage, 79,114; while 159 left, measuring jointly 76,058 tons. The arrivals at Puerto Plata in 1882 were 136, with 62,472 tons of cargo, of which 40 were steamers, with 60,689 tons; 87 sailing-vessels, with 1,783 tons.

SERVIA, a kingdom in Eastern Europe. Complete independence was recognized in the Treaty of Berlin. The Constitution of 1869 reaffirmed succession in the family of Obrenovich, declared the responsibility of the ministers to the Assembly, and vested the legislative power in the Skuptschina, jointly with the sovereign. The Senate was transformed into a Council of State, charged with the elaboration of laws. The Skuptschina, which is elected for three years and holds sessions annually, consists of 174 members, of whom 129 are elected by the people, every tax-payer having a vote, and 45 are appointed by the King. A Great National Assembly, composed of four times the number of the ordinary, is elected to decide on constitutional questions. Servia was proclaimed a kingdom, March 6, 1882.

The King, Milan I, is the fourth of the dynasty. He was born in August, 1854, and succeeded his cousin, Prince Michail, assassinated June 10, 1868. The Cabinet is composed of the following members: President of the Council and Minister of the Interior, N. Cristich; Minister of Foreign Affairs, M. Bogwichevich; Minister of War, Col. Petrovich; Minister of Justice, G. Pantelich; Minister of Finance, A. Spasich; Minister of Public Works, C. Protich; Minister of Instruction and Ecclesiastical Affairs, G. Pantelich, *ad interim*.

Area and Population.—The area of Servia is 20,850 square miles, including 4,250 square miles added by the Treaty of Berlin, from which the Turkish population has nearly all emigrated. The population returned by the census of 1878 was 1,669,837, composed of 850,275 males and 819,062 females; estimated population at the beginning of 1883, 1,810,606. The bulk of the population are of Serbic race and of the Orthodox Greek religion. There were in 1878 13,867 Mohammedans, 3,493 Israelites, 4,178 Roman Catholics, and 27,289 gypsies. Belgrade, the capital, contained at the beginning of 1883 an estimated population of 86,177.

Commerce.—The chief trade is with Austria. The largest article of export is live hogs. The principal exports in 1881 were of the following quantities: Hogs, 325,240; cattle, 27,752; sheep and goats, 64,935; grain, 26,523,869 okes (the Turkish oke = 2.83 pounds); dried prunes, 10,563,201 okes; wine, 2,460,298 okes.

Finances.—The revenue is derived mainly from direct imposts. The budget for 1882-'83 makes out the receipts as 34,980,000 dinars, or francs, and the expenditures as 34,469,919 dinars. The public debt is over 100,000,000 francs, incurred for the construction of the Belgrade and Vranja Railroad, to repay the war requisitions, and lesser sums to compensate the disinherited Turkish proprietors, and repay a war debt to Russia.

The Army.—The introduction of the German military system causes a considerable increase in the national expenditures. Before the war with Turkey the military forces consisted of a militia. The standing army musters 9,710 men.

The reorganization is calculated to create an available war force of 165,000 men.

Political Crisis.—King Milan, having entered on a career of despotic violence by dissolving the Skuptschina in 1882 and refusing to recognize the constitutional majority, did not shrink from the conflict which he invited, but in 1883 openly established a military despotism in the place of parliamentary government. The King and the Pirotchanatz ministry were not restrained from pursuing their pro-Austrian policy by the popular disapprobation. The decision of the *Conférence à quatre* settled the route of the railway to connect Western Europe with Constantinople, which passes through Belgrade and Nish (see AUSTRIA-HUNGARY). The discord between Russia and Servia was increased by the enactment of a new law regulating the relations between church and the state, particularly with reference to the election of a metropolitan. The appointment of the primate had previously been left to the church, and thus controlled by the Emperor of Russia. The arbitrary suspension of the metropolitan by King Milan in 1882 exasperated the people and drove the clergy into the camp of the opposition. The Russians were therefore the more inclined to contest the ecclesiastical question as a means of preserving their political influence. The Synod elected the Archimandrite Theodosius Mraovich in April, after the provisions of the new law. The new metropolitan was consecrated a few days later. The Servian chaplain in Moscow, having complied with the request of the Servian Government to pray for the new archbishop, was ignominiously expelled from Russia during the coronation, by order of the metropolitan of Moscow. In August, King Milan visited Vienna, where he was cordially received, and subsequently attended the autumn manoeuvres of the German army as the guest of Emperor William. These friendly conferences were intended as a counter-check to Russian political activity in Montenegro, Roumania, Bulgaria, and Eastern Roumelia. The marriage of the Servian pretender, Peter Karageorgevich, to the daughter of the Prince of Montenegro, indicated the complete withdrawal of Russian confidence in King Milan and the prosecution of Servian schemes without the Obrenovichs.

The Servians are thoroughly imbued with the idea of popular sovereignty. They have always been conscious of their power, and in former struggles with their rulers have come out victorious. Recently doctrines of European radicalism and Russian socialism have been widely disseminated among the peasantry by Belgrade professors and other Servians educated at Paris and in Germany.

The political parties in Servia were the Conservative, the Liberal, and the Radical. The party at the helm of government, the Conservative, may be described as the party of the King and of the Austrians, and described itself as the Progressive party, because it pursued

the policy of developing the resources of the country. The King, in breaking with Russia and accepting Austrian domination, adopted a course which was inevitable and advantageous to the country. The Pirochanatz ministry was appointed after the dismissal of Ristich to consummate the accommodation with the Hapsburg Government. By excluding Servian hogs and other products, through the operation of a prohibitory tariff, Austria could cut the Servian farmers off from the only natural outlet for their produce. A favorable commercial treaty was arranged. The Servian concessions favored Austrian manufactures at the expense of the English trade. Servia came to terms on the railroad question.

The popular jealousy at the humiliating subserviency of their Government to a foreign power was intense. The railroad convention, however advantageous from a commercial point of view, leveled all defensive barriers, and laid the country open to the ingress of an Austrian army at any moment. The Liberal party, composed of the followers of Ristich, was as weak in numbers as the supporters of the King. The Radical party was composed of the liberal elements of the old Ristich party, reorganized by Pashich, Tedorovich, and other professors and journalists, whose teachings induced it with a more advanced and democratic character. The refusal of the King to be controlled by the result of the last election greatly increased its strength. The following of the pretender Karageorgevich was not large, and its influence was restricted by the Draconic laws against anti-dynastic agitation. The declared foreign policy of the Radical party was to cultivate friendly relations with both Austria and Russia, without entering into any alliance.

The King, who was absent during the autumn elections on his visit to Germany, trusted to his ministers to secure the forty-and-odd votes necessary for a majority. The Radicals, with the dozen votes or so of the Ristich party, had a clear majority as the result of the election of September, which the invalidation of the returns in certain districts failed to upset. The Assembly was opened on the 28th of September. The victorious party attempted to elect a president by acclamation, but after a stormy scene were obliged to go through the formality of a vote. King Milan, determined to be master, chose a desperate course. As Pirochanatz and his colleagues, who had resigned, were unwilling to be the instruments of his will, he appointed a new Progressist ministry under the presidency of Nikola Cristich. The Skuptschina was at once dissolved. The King sounded the officers of the army and made sure of their fidelity. The disarmament of the militia was proceeding in pursuance of a previous enactment. The people in certain districts of the mountains refused to deliver up their arms. This complication rendered the situation extremely critical. The Radical leaders deemed the moment favorable for a revolutionary at-

tempt, and prepared a constitution, embodying democratic principles under monarchical forms. Pashich and the whole eighteen members of the Radical committee were arrested in the dead of night and thrown into prison. Liberty of the press and of assembly was suspended. Martial law was proclaimed in various districts. In Zaizar, the principal seat of the revolt, troops were speedily collected. Wherever there was a sign of resistance, soldiers were quartered on the people. The people of the eastern and southeastern districts of the country, who are largely of Roumanian extraction, were soon in open rebellion. At Cerna Reka there were 8,000 insurgents in arms against the Government. The revolt did not become general, because the Servian people had no strong confidence in the Radical leaders, and were not ripe for a political change. The insurrection was put down by the military after a few encounters. The Radical leaders were court-martialed and condemned. Some of the least influential were executed, others were pardoned. The revolted districts were not easily restored to order, although the military power was employed with relentless severity. Hundreds of arrests were made, and a large number were executed. The new law of conscription was passed, with the disarmament bill, in the spring session of the Skuptschina. The various arbitrary acts of Milan, culminating in the sending home of the Skuptschina, inspired them with a thorough distrust and dislike of the King, though it was not easy to alienate them from the popular Obrenovich dynasty.

The increased taxes and the oppressive military conscription appealed powerfully to those who were susceptible only to immediate practical grievances, and not conversant with questions of high politics or capable of patriotic enthusiasm. The disarmament of the militia at this time provoked resistance because the Servians thought it deprived them of the means of defending their national liberties, which was the reason why King Milan proceeded so expeditiously to have it carried into effect.

SHERIDAN, Philip Henry, Lieutenant-General of the United States Army, born in Somerset, Perry co., Ohio, March 6, 1831. A few years at the village school, followed by service in the village store, furnished his education and training until a fortunate application to the Congressman of his district made him, in 1848, a cadet at West Point. He should have been graduated in 1852; but a year's suspension, the result of a quarrel with a fellow-student, transferred him to the class of 1853, in which he ranked 84th among its 52 members. He was appointed a brevet second-lieutenant of infantry, July 1, 1853; in the following year was assigned to the 1st Infantry, in Texas; and on Nov. 23, 1854, received his commission as second-lieutenant of the 4th Infantry. With the latter regiment he served during the next six years, in Washington Territory and Oregon. In one of Gen. Scott's orders we find this mention of him:

"April 28, 1856, bvt. Lt.-Col. E. J. Steptoe, 9th Infantry, commanding Cos. A, E, F, and I, same regiment, and detachments of Co. E, 1st Dragoons, and Co. L, 3d Artillery, in all 200 men, at the Cascades, W. T., repulsed the Indians in their attack of that place. The troops landed under fire, routing and dispersing the enemy at every point. . . . Second-Lieutenant Philip H. Sheridan, 4th Infantry, is especially mentioned for his gallantry."

The outbreak of the civil war made promotion rapid, both through the resignation of Southern officers and the creation of new regiments; and Sheridan, who thus secured a first-lieutenancy in the Fourth Infantry on March 1, 1861, received a captaincy in the Thirteenth, on the 14th of May. Still, save for six weeks' service as president of a board for auditing claims at St. Louis, that memorable year brought him little employment and no laurels. The day before Christmas he was appointed quartermaster on the staff of Gen. Curtis, commanding the Army of Southwest Missouri. On being relieved from Curtis's staff, he reported to Gen. Halleck, whom he accompanied in his advance upon Corinth, and was by him recommended to the Governor of Michigan, who had applied for some regular officer to take charge of the 2d Michigan Cavalry. Commissioned May 25, 1862, as colonel of this regiment, then near Corinth, Sheridan at once took part with it in Elliot's raid against the railroad, which was destroyed at Booneville. During June he commanded the 2d Cavalry Brigade in several skirmishes, and on the 1st of July fought a brilliant battle at Booneville. His appointment as brigadier-general of volunteers was dated from the action at Booneville.

During the autumn of 1862 Sheridan was transferred to Kentucky, and there received command of the Eleventh Division of the Army of the Ohio, under Buell. Moving out from Louisville with Buell against Bragg, he took part, October 8th, in the hard-fought battle at Perryville, where he manoeuvred his division with conspicuous skill and effect. Rosecrans succeeded Buell in command of what became known as the Army of the Cumberland, and at the prolonged and bloody battle of Murfreesboro, Sheridan, for several hours in the first day's fighting, held the key-point, displaying superb tactical skill and the greatest gallantry. All his brigade commanders were killed in this battle, and on Rosecrans's recommendation he was made major-general of volunteers, to date from Dec. 31, 1862, the opening of that deadly struggle among the cedar-brakes of Stone river.

In March, 1863, Sheridan engaged in the pursuit of Van Dorn to Columbia and Franklin, making captures near Eagleville. Advancing with Rosecrans's army from Murfreesboro to Tullahoma, and across the Cumberland mountains and the Tennessee, Sheridan, on September 19th and 20th, distinguished himself again in the battle with Bragg at Chickamauga.

Rosecrans fell back to Chattanooga, and the command of his besieged army was transferred to Thomas. Grant, arriving with re-enforcements from Vicksburg, resolved to dislodge Bragg, who was posted on Lookout mountain and Missionary Ridge. Hooker having carried Lookout mountain, Thomas assaulted the Ridge November 25th, with overwhelming success. Sheridan's division was the first to cross the crest, and pressed the enemy's rear-guard until long after dark, capturing wagons and artillery. This was the culminating point of Sheridan's career at the West, although he continued to serve through the winter in East Tennessee, and on January 17th was engaged in a skirmish at Dandridge.

In the spring of 1864, Grant, now lieutenant-general, established his headquarters in Virginia. He told Halleck he must have an energetic commander for the cavalry there, and Halleck, mindful of the result of his former recommendation, brought Sheridan forward again. "The very man!" answered Grant; and accordingly Sheridan, on April 4th, took command of the cavalry corps of the Army of the Potomac. When the May campaign of this army opened, he pioneered its path to the Wilderness, and thence to Spottsylvania, skirmishing on the 5th and 6th, and fighting a battle at Todd's Tavern on the 7th. Two days later he made a cavalry expedition within the enemy's lines to the Chickahominy and the James, dashing upon the outworks of Richmond itself, where he took a hundred prisoners, and thence moving to Hazall's Landing, from which point, after resting three days, he returned to the army on the 24th, having destroyed many miles of railroad-track, besides trains and a great quantity of rations, and recapturing 375 Union soldiers on their way to Libby Prison. This expedition included repulses of the enemy at Beaver Dam, May 10th, and at Meadow Bridge on the 12th, and the defeat, on the intervening day, of J. E. B. Stuart's cavalry at Yellow Tavern, where Stuart was killed. Sheridan was next engaged at Hanover town and Totopotomoy creek, May 27th; Hawes's Store, May 28th; Matadequin creek, May 30th; Cold Harbor, May 31st and June 1st. On June 6th he was sent with two divisions to cut the Virginia Central Railroad near Charlottesville, and to escort across to Grant's army the Shenandoah Valley forces of Gen. Hunter. The enemy's cavalry, under Hampton, disputed his progress at Trevillian Station, June 11th, but were driven back after a severe battle. The next day, however, Sheridan, satisfied that neither Charlottesville nor Gordonsville could be reached, and hearing nothing of Hunter, withdrew his forces, having broken the railroad at Trevillian. On his return the enemy's cavalry attacked him at Tunstall, on the 21st, and he skirmished again on the 24th at St. Mary's Church. Toward the end of July Sheridan moved north of the James, to aid Gen. Hancock's operations at

Deep Bottom, and on the 28th was engaged at Darbytown.

Meanwhile, Early maintained a threatening position in the Valley. Grant, accordingly, on the 7th of August, put Gen. Sheridan in command of the Middle Military Division, with an army comprising two divisions of his own cavalry, the Sixth Corps, under Wright, a part of the Nineteenth, under Emory, and the Army of West Virginia, under Crook. Six weeks passed without result, as Early had been re-enforced, and kept Sheridan on the defensive near Harper's Ferry. But on September 19th, when Early's forces had been diminished, Sheridan crossed the Opequon, and, in a hard battle, completely defeated him, sending him, as Sheridan telegraphed, "whirling through Winchester." The next day, President Lincoln, at Grant's recommendation, appointed Sheridan a brigadier-general in the regular army. Pursuing Early up the Valley turnpike, on the 20th, Sheridan found him strongly posted on Fisher's Hill, just beyond Strasburg. Secretly moving Crook's command through the woods, he turned the enemy's left on the 22d, and drove him from his stronghold, capturing 16 guns. The losses of Sheridan and those of Early were almost exactly equal in these two battles combined, being about 5,400 each; but Sheridan had also captured 21 guns and many small-arms. Sheridan continued the pursuit up the Valley, and took post at Harrisonburg, while Early withdrew to Brown's Gap. Believing it impracticable or hazardous to proceed either to Lynchburg or Charlottesville, Sheridan, with Grant's approval, withdrew down the Valley, burning its mills, barns, and crops on the way. Early followed with his cavalry under Rosser and Lomax to Tom's Brook, near Fisher's Hill, where Sheridan's horsemen, under Torbert, turned and defeated them, October 9th, capturing 11 cavalry-guns, and indeed almost "everything on wheels," and driving them back twenty miles. Sheridan then passed through Strasburg and posted his troops on the farther bank of Cedar creek, while he himself, on the 16th, went to Washington in response to a request from Mr. Stanton, for consultation. Before sunrise of October 19th, Early, who had been re-enforced, aided by a fog, surprised the left of the Union army, held by Crook's command, and uncovered the position also of the Nineteenth Corps, capturing 24 guns and about 1,400 prisoners. Gen. Wright succeeded in retaining his grasp on the turnpike by moving the Sixth Corps to its western side and the cavalry to its eastern, but the whole army, in the process, had been driven back beyond Middletown. Sheridan, who was at Winchester, on his return from Washington, hearing the noise of battle, dashed up the pike with an escort of twenty men, rallying the fugitives on the way, and, after a ride of a dozen miles, reached the army, which received him with great enthusiasm. Having fully prepared his forces, during a lull of sev-

eral hours, he ordered an advance, and swept the enemy from the field in one of the most overwhelming routs of the war. All of the lost Union guns were retaken, and 24 Confederate guns and many wagons were captured. Congress passed a vote of thanks to him and his troops for the "brilliant series of victories in the Valley," and especially the one at Cedar creek. Sheridan was appointed by the President a major-general in the regular army, "for the personal gallantry, military skill, and just confidence in the courage and patriotism of your troops, displayed by you on the 19th day of October."

On Feb. 27, 1865, Gen. Sheridan moved his cavalry, 10,000 strong, up the Valley to Waynesboro, where, March 2d, it overthrew the remnant of Early's force, capturing about 1,500 men. He then destroyed the locks of the James river canal, and broke the railroads toward Gordonsville and Lynchburg. Making his way toward Grant's army, he arrived at White House, March 19th.

With Sheridan's cavalry at his disposal, Grant now began the final campaign. Crossing the Peninsula to James river, March 24th, Sheridan passed to the left of the Union army, and on the 29th occupied Dinwiddie Court-House. Two days later he was attacked by a heavy force of Lee's infantry under Pickett and Johnson; but the following day, April 1st, being re-enforced by the Fifth Corps, under Warren, Sheridan, by a beautiful tactical movement, entrapped and completely routed Pickett and Johnson at Five Forks, capturing thousands of prisoners. Petersburg being assaulted the next morning, Lee abandoned that city and Richmond, and took to flight. The pursuit was prompt, with Sheridan far in the van, constantly harassing the enemy, and finally, aided by the Sixth and Second Corps, capturing nearly all of Ewell's command, on the 8th, at Sailor's creek. Two days later, Sheridan again fought the enemy at Appomattox Station, and on the 9th occurred Lee's surrender.

Later in April Sheridan conducted an expedition into North Carolina, and on June 3d took command of the Military Division of the Southwest, at New Orleans. Relieved by President Johnson, Aug. 26, 1867, during the reconstruction troubles in Louisiana (see "Annual Cyclopædia" for 1867, pp. 451 to 462), he was assigned, September 12th, to the Department of the Missouri. On the 4th of March, 1868, he was promoted to the rank of lieutenant-general, and on the 16th assumed command of the Division of the Missouri, with headquarters at Chicago. During the Franco-German War of 1870-'71 he visited Europe, and was present as a spectator at several famous engagements. On Nov. 1, 1883, by direction of President Arthur, he assumed command of the Army of the United States, with headquarters at Washington, in place of Gen. Sherman, who was relieved by request, preparatory to retirement in the spring of 1884.

SIEMENS, Charles William, an English electrician and engineer, died in London, Nov. 20, 1888, of rupture of the heart, the result of a fall. He was born at Lenthe, in Hanover, April 4, 1823, and was educated in the gymnasium at Lübeck, the Polytechnic of Magdeburg, and Göttingen University. In 1842 he entered as an apprentice the engine-works of Count Stolberg, and the following year he went to England to introduce the electroplating process invented by his elder brother, Werner Siemens, and improved by himself. Applying to the firm of Elkington, he found them engaged in the same process, but was able to furnish valuable suggestions as to practical details. In 1844 he returned to England to patent a differential governor for steam-engines, invented by the two brothers. From that time he remained in England, becoming naturalized in 1859.

In conjunction with his brother he brought out the anastatic printing process in 1844, and perfected the chronometric governor in 1847. He turned his attention to the study of the dynamical theory of heat. The recovery of the heat of the exhausted steam of an engine was made the subject of experiments. In 1851 he introduced the Siemens water-meter. Between 1856 and 1861, with the assistance of his brother Frederick, he worked out the regenerative gas-furnace, and in 1867 he applied the invention in the manufacture of open-hearth steel. He experimented on the manufacture of iron and steel direct from the ore, establishing for this purpose the experimental works at Birmingham, from which samples of steel were sent to the Universal Exposition at Paris. Dr. C. W. Siemens interested himself in telegraphy as early as 1848, and in 1858, in connection with Werner Siemens and Halske, of Berlin, and with his brother Carl, he established the works which manufactured the Direct United States, the Indo Telegraph, and other cables, including the one to be laid for the Bennett-Mackay company from Ireland to the United States in 1884.

Dr. Siemens gave much attention to pure science, and was a prominent participant in the proceedings of the Royal Institution, the British Association, the Institution of Civil Engineers, the Iron and Steel Institute, and other learned bodies devoted to theoretical and practical science, and was also a frequent contributor to the scientific press.

SIMS, James Marion, an American surgeon, born in Lancaster district, S. C., Jan. 25, 1813; died in the city of New York, Nov. 18, 1888. He was graduated at South Carolina College in 1832, studied medicine, and entered upon practice in Charleston. Thence he went to Philadelphia, where he took a full course at the Jefferson Medical College, and in 1836 he settled in Montgomery, Ala., where he turned his attention more especially to surgery. The idea of curing vesico-vaginal fistula, at that date considered incurable, originated with Dr. Sims about 1845, and for the

purpose of demonstrating his theories he established a private hospital for women in Montgomery, and supported it for four years at his own expense. In the course of his experiments he invented many new instruments, one of which was a speculum that still bears his name. The peculiarity of Dr. Sims's treatment of the distressing ailment above named was the substitution of silver wire for silken sutures. In after-years he extended the use of metallic sutures to every department of surgery where they are employed.

In 1849 Dr. Sims was prostrated with a serious illness; in 1853 he began to improve, and after his removal to New York his health grew steadily better. During this period he pondered over the idea of establishing a woman's hospital, and in May, 1854, soon after reaching New York, he delivered an address upon that subject. Much discussion ensued, and unexpected opposition followed. A public meeting was held for the purpose of giving definite shape to his idea; and Drs. Delafield, Francis, Mott, Stevens, Green, and Sims, together with Peter Cooper and the Hon. E. C. Benedict, were appointed a committee for organizing a hospital for the treatment of diseases of women. From this movement originated the Woman's Hospital Association. A building on Madison Avenue was leased for three years, and a temporary hospital was opened in May, 1855, with Dr. Sims as surgeon-in-chief. A charter was procured in 1857, and in 1858 the Legislature of New York appropriated \$50,000 for the new hospital. Soon after, the city authorities gave the site on which the hospital now stands. Dr. Sims devoted himself with enthusiastic energy to this great work, and was largely aided and encouraged by professional brethren, as well as by ladies and gentlemen of New York. He went abroad to study the subject, and by special invitation operated in several of the great hospitals in Paris, Brussels, London, and Dublin, and received numerous decorations.

Dr. Sims took his family to Europe in 1862, and a large part of his time during the next six years was spent there. In 1870, while he was on a visit to Paris, the Franco-Prussian War broke out, and he took charge of the Anglo-American Ambulance Corps as surgeon-in-chief. He built up a large practice, more particularly in France and Belgium.

Dr. Sims was an honorary member of many medical and scientific societies both in Europe and America. In 1875 he was elected President of the American Medical Association. His more important publications are, "Trismus Nascentium"; "Silver Sutures in Surgery" (1858); "Clinical Notes on Uterine Surgery" (1866); "History of the Discovery of Anæsthesia"; and "Treatise on Ovariectomy." He was also a frequent contributor to medical and surgical journals.

SMITH, James Lawrence, an American chemist and mineralogist, born near Charleston, S. C.,

Dec. 16, 1818; died in Louisville, Ky., Oct. 12, 1883. He received a classical education at Charleston College, and then studied at the University of Virginia. Afterward, having chosen medicine for a profession, he received his degree from the Medical College of South Carolina. This course he supplemented by three years' study in Europe. In 1841 his first memoir, "On the Means of detecting Arsenic in the Human Body," marked him as an investigator of the first rank. He began the practice of medicine in Charleston, and at the same time delivered an important series of lectures on toxicology. Soon after, he was appointed by the State of South Carolina to assay the bullion then coming into commerce from the gold-fields of Georgia and North and South Carolina. His attention was also directed at the time to the marl-beds in the vicinity of Charleston. His investigations on the value of these deposits for agricultural purposes were among the earliest scientific contributions on this subject. During these years he prepared a report on "The Meteorological Conditions, Character of Soils, and Cultures, affecting the Growth of Cotton."

In 1846 Mr. Buchanan (afterward President), at the request of the Sultan of Turkey, recommended Dr. Smith as a competent authority to suggest methods for the cultivation of cotton in the Turkish provinces. On reaching the East, he found the scheme somewhat impracticable, and subsequently accepted the appointment of mining engineer from the Sultan. In this capacity his services were of the greatest value, and the Turkish Government still derives an important portion of its revenue from his discoveries of ores and coal. Chief among these was that of emery, whose subsequent development in this country is largely due to the papers published by Dr. Smith. "The Thermal Waters of Asia Minor" was likewise a subject to which he devoted much attention while in the Turkish employ.

In 1851 he returned to the United States. He devised the inverted microscope, whose construction he had superintended while in Paris. His appointment to the chair of Chemistry in the University of Virginia dates from this period. While occupying this post, with the aid of his assistant, George J. Brush (now of the Sheffield Scientific School), he prepared an extensive memoir on the "Re-examination of American Minerals." It included examinations, with analyses, of thirty-seven species, "forming," says Prof. B. Silliman, "at that time, the most important contributions yet made by any American chemist." In 1854-'55 he accepted the professorship of Chemistry in the Medical Department of the University of Louisville, and settled there. Subsequently he became President of the Louisville Gas-Works, which he personally superintended.

In 1867 he was one of the commissioners to the Paris Exposition, and furnished for the

Government reports an able contribution on "The Progress and Condition of Several Departments of Industrial Chemistry." Again, at Vienna, in 1873, he represented the United States, and his report on "Chemicals and Chemical Industries" supplements his excellent work at the earlier exhibition. At the Centennial held at Philadelphia in 1876, he was one of the judges in the department relating to chemical arts, and contributed a valuable paper on petroleum to the official reports.

Of late years, his attention was devoted very largely to the chemistry of meteorites, and his collection of these celestial bodies is probably not surpassed in this country. It has recently become the property of Harvard College. He was also occupied with the separation of some of the rarer earths, and in 1878 he announced his discovery of the element mosandrium.

Prof. Smith was a member of many of the learned societies in this country and abroad. He was one of the original members of the National Academy of Sciences, and in 1872 was the presiding officer of the American Association for the Advancement of Science. The French Academy of Sciences elected him a corresponding member in the department of Mineralogy. His published papers were very numerous; the more important of these were collected and published by him, under the title of "Mineralogy and Chemistry, Original Researches" (Louisville, Ky., 1873).

SOUND-SIGNALS. The sound-signals generally used to guide mariners, especially during fogs, are, with certain modifications—sirens, trumpets, steam-whistles, bell-boats, bell-buoys, whistling-buoys, bells struck by machinery, cannons fired by powder or gun-cotton, rock-ets, and gongs.

Gongs.—Gongs are somewhat used on light-ships, especially in British waters. They are intended for use at close quarters. Leonce Reynand, of the French lighthouse service, has given their mean effective range as barely 550 yards. They are of most use in harbors, short channels, and like places where a long range would be unnecessary. They have been used but little in United States waters. The term "effective range" is used here to signify the actual distance at which, under the most unfavorable circumstances, a signal can generally be heard on board of a paddle-wheel steamer in a heavy sea-way.

Guns.—The use of guns is not so great as it once was. Instances are on record in which they were quite serviceable. Admiral Sir A. Milne said he had often gone into Halifax harbor, in a dense fog like a wall, by the sound of the Sambro fog-gun. But in the experiments made by the "Trinity House" off Dungeness in January, 1864, in calm weather, the report of an eighteen-pounder, with three pounds of powder, was faint at four miles. Still, in the Trinity House experiments of 1865, made in light weather with a light gun, the report was

clearly heard seven miles away. Dr. Gladstone records great variability in the range of gun-sound in the Holyhead experiments. Prof. Henry says that a twenty-four-pounder was used at Point Boneta, San Francisco Bay, Cal., in 1856-'57, and that, by the help of it alone, vessels came into the harbor during the fog at night as well as in the day, which otherwise could not have entered. The gun was fired every half-hour, night and day, during foggy and thick weather in the first year, except for a time when powder was lacking. During the second year there were 1,582 discharges. It was finally superseded by a bell-boat, which in its turn was after a time replaced by a siren. A gun was also used at West Quoddy Head, Maine. It was a carronade, five feet long, with a bore of $5\frac{1}{2}$ inches, charged with four pounds of powder. The gun was fired on foggy days when the Boston steamer was approaching the lighthouse from St. Johns, and the firing was begun when the steamer's whistle was heard, often when she was six miles away, and was kept up as fast as the gun could be loaded, until the steamer answered with its whistle. The report of the gun was heard from two to six miles. "This signal was abandoned," Prof. Henry says, "because of the danger attending its use, the length of intervals between successive explosions, and the brief duration of the sound, which renders it difficult to determine its direction with accuracy." In 1872 there were three fog-guns on the English coast, iron eighteen-pounders, carrying a three-pound charge of powder, which were fired at intervals of fifteen minutes in two places, and of twenty minutes in the other. The average duration of fog at these stations was said to be about six hours, and, as it not unfrequently lasted twenty hours, each gun required two gunners, who had to undergo severe labor, and the risk of remissness and irregularity was considerable. In 1881 the interval between charges was reduced to ten minutes. The Trinity House, in its experiments at South Foreland, found that the short twenty-four-pound howitzer gave a better sound than the long eighteen-pounder. Tyndall, who had charge of the experiments, sums up as to the use of the guns as fog-signals by saying:

The duration of the sound is so short that, unless the observer is prepared beforehand, the sound, through lack of attention, rather than through its own powerlessness, is liable to be unheard. Its liability to be quenched by local sound is so great that it is sometimes obliterated by a puff of wind taking possession of the ears at the time of its arrival. Its liability to be quenched by an opposing wind, so as to be practically useless at a very short distance to windward, is very remarkable. . . . Still, notwithstanding these drawbacks, I think the gun is entitled to rank as a first-class signal.

The minute-gun at sea is known the world over as a signal of distress. The English light-ships fire guns to attract the attention of the life-boat crew when shipwrecks take place in sight of the ships, but out of sight of the boats;

and guns are used as signals of approaching floods at freshet-times in various countries.

Rockets.—As a signal in rock lighthouses, where it would be impossible to mount large pieces of apparatus, the use of a gun-cotton rocket has been suggested by Sir Richard Collinson, deputy-master of the Trinity House. A charge of gun-cotton is inclosed in the head of a rocket, which is projected to the height of perhaps 1,000 feet, when the cotton is exploded, and the sound shed in all directions. Comparative experiments with the howitzer and rocket showed that the howitzer was beaten by a rocket containing twelve ounces, eight ounces, and even four ounces of gun-cotton. Large charges do not show themselves so superior to small charges as might be expected. Some of the rockets were heard at a distance of twenty-five miles. Tyndall proposes to call it the Collinson rocket, and suggests that it might be used in lighthouses and light-ships as a signal by naval vessels.

Bells.—Bells are in use at every United States light-station, and at many they are run by machinery actuated by clock-work, made by Mr. Stevens, of Boston, who, at the suggestion of the Lighthouse Board, has introduced an escapement arrangement moved by a small weight, while a larger weight operates the machinery which strikes the bell. These bells weigh from 800 to 3,000 pounds. There are about 125 in use on the coasts of the United States. Experiments made by the engineers of the French Lighthouse Establishment, in 1861-'62, showed that the range of bell-sounds can be increased with the rapidity of the bell-strokes, and that the relative distances for 15, 25, and 60 bell-strokes a minute were in the ratio of 1, $1\frac{1}{4}$, and $1\frac{3}{4}$. The French also, with a hemispherical iron reflector backed with Portland cement, increased the bell range in the ratio of 147 to 100 over a horizontal arc of 60° , beyond which its effect gradually diminished. The actual effective range of the bell-sound, whatever the bell-size, is comparatively short, and, like the gong, it is used only where it needs to be heard for short distances. Mr. Cunningham, Secretary of the Scottish Lighthouse Establishment, in a paper on fog-signals, read in February, 1868, says the bell at Howth, weighing $2\frac{1}{2}$ tons, struck four times a minute by a 60-pound hammer falling ten inches, has been heard only one mile to windward against a light breeze during fog; and that a similar bell at Kingston, struck eight times a minute, had been so heard three miles away as to enable the steamer to make her harbor from that distance. Mr. Beaseley, C. E., in a lecture on coast fog-signals, May 24, 1872, speaks of these bells as unusually large, saying that they and the one at Ballycotton are the largest on their coasts, the only others which compare with them being those at Stark Point and South Stack, which weigh $81\frac{1}{2}$ cwt. and $41\frac{1}{2}$ cwt. respectively. Mr. Cunningham, speaking of the fog-bells at Bell Rock and

Skerryvore lighthouses, says he doubts if either bell has been the means of saving a single vessel from wreck during fog, and he does not recall an instance of a vessel reporting that she was warned to put about in the fog, or that she ascertained her position in any respect by hearing the sound of the bell in either place. Gen. Duane, U. S. A., says a bell, whether operated by hand or machinery, can not be considered an efficient fog-signal on the sea-coast. In calm weather it can not be heard half the time at a greater distance than one mile, while in rough weather the noise of the surf will drown its sound to seaward altogether. The use of bells is required, by the International Code, on ships of all nations, at regular intervals during fog. But Turkish ships are allowed to substitute the gong or gun, as the use of bells is forbidden to the followers of Mohammed.

Whistling-Buoys.—The whistling-buoy now in use was patented by Mr. J. M. Courtenay, of New York. It consists of an iron, pear-shaped bulb, 12 feet across at its widest part, and floating 12 feet out of water. Inside the bulb is a tube 33 inches across, extending from the top through the bottom to a depth of 32 feet, into water free from wave-motion. The tube is open at its lower end, but projects, air-tight, through the top of the bulb, and is closed with a plate having in it three holes, two for letting the air into the tube, and one between the others for letting the air out to work the ten-inch locomotive whistle with which it is surmounted. These holes are connected with three pipes which lead down to near the water-level, where they pass through a diaphragm which divides the outer cylinder into two parts. The great bulb which buoys up the whole mass rises and falls with the motion of the waves, carrying the tube up and down with it, thus establishing a piston-and-cylinder movement, the water in the tube acting as an immovable piston, while the tube itself acts as a moving cylinder. Thus the air admitted through valves, as the buoy rises on the wave, into that part of the bulb which is above water, is compressed, and, as the buoy falls with the wave, it is further compressed and forced through a 2½-inch pipe which at its apex connects with the whistle. The dimensions of the whistling-buoy have recently been much diminished without detracting materially from the volume of sound it produces. It is now made of four sizes. The smallest in our waters has a bulb six feet in diameter, and a tube ten feet in length, and weighs but 2,000 pounds. The largest and oldest whistling-buoy has a 12-foot bulb, a tube 32 feet long, and weighs 12,000 pounds.

VOL. XXIII.—46 A

There are now 84 of these whistling-buoys on the coast of the United States, which have cost, with their appurtenances, about \$1,200 each. It is a curious fact that, in proportion as they are useful to the mariner, they are obnoxious to the house-dweller within ear-shot of them, and that the Lighthouse Board has to weigh the petitions and remonstrances before setting these buoys off inhabited coasts. They can at times be heard 15 miles, and emit an inexpressibly mournful and saddening sound.

The inspector of the First Lighthouse District, Commander Picking, established a series of observations at all the light-stations in the neighborhood of the buoys, giving the time of hearing it, the direction of the wind, and the state of the sea, from which it appears that in January, 1878, one of these buoys was heard every day at a station 1¼ mile distant, every day but two at one 2½ miles distant, 14 times at one 7½ miles distant, and 4 times at one 8½

FIG. 1.—COURTENAY'S WHISTLING-BUOY.

miles distant. It is heard by the pilots of the New York and Boston steamers at a distance of one fifth of a mile to 5 miles, and has been frequently heard at a distance of 9 miles, and even, under specially favorable circumstances, 15 miles.

The whistling-buoy is also used to some extent in British, French, and German waters, with good results. The latest use to which it has been put in this country has been to place it off the shoals of Cape Hatteras, where a light-ship was wanted but could not live, and where it does almost as well as a light-ship would have done. It is well suited for such broken and turbulent waters, as the rougher the sea the louder its sound.

Bell-Buoys.—The bell-boat, which is at most a clumsy contrivance, liable to be upset in heavy weather, costly to build, hard to handle, and difficult to keep in repair, has been superseded by the Brown bell-buoy, which was invented by the officer of the lighthouse establishment whose name it bears. The bell is mounted on the bottom section of an iron buoy 6 feet 6 inches across, which is decked over and fitted with a framework of 3-inch angle-iron 9 feet high, to which a 300-pound bell is rigidly attached. A radial grooved iron plate is made fast to the frame under the bell

FIG. 2.—BROWN'S BELL-BUOY.

and close to it, on which is laid a free cannon-ball. As the buoy rolls on the sea, this ball rolls on the plate, striking some side of the bell at each motion with such force as to cause it to toll. Like the whistling-buoy, the bell-buoy sounds the loudest when the sea is the roughest, but the bell-buoy is adapted to shoal water, where the whistling-buoy could not ride; and, if there is any motion to the sea, the bell-buoy will make some sound. Hence the whistling-buoy is used in roadsteads and the open sea, while the bell-buoy is preferred in harbors, rivers, and the like, where the sound-range needed is shorter, and smoother water usually obtains. In July, 1888, there were 24 of these bell-buoys in United States waters.

They cost, with their fittings and moorings, about \$1,000 each.

Locomotive-Whistles.—It appears from the evidence given in 1845, before the select committee raised by the English House of Commons, that the use of the locomotive-whistle as a fog-signal was first suggested by Mr. A. Gordon, C. E., who proposed to use air or steam for sounding it, and to place it in the focus of a reflector, or a group of reflectors, to concentrate its sound into a powerful phonic beam. It was his idea that the sharpness or shrillness of the whistle constituted its chief value. And it is conceded that Mr. C. L. Daboll, under the direction of Prof. Henry, and at the instance of the United States Lighthouse Board, first practically used it as a fog-signal by erecting one for use at Beaver Tail Point, in Narragansett Bay. The sounding of the whistle is well described by Price-Edwards, a noted English lighthouse engineer, "as caused by the vibration of the column of air contained within the bell or dome, the vibration being set up by the impact of a current of steam or air at a high pressure." It is probable that the metal of the bell is likewise set in vibration and gives to the sound its timbre or quality. It is noted that the energy so excited expends its chief force in the immediate vicinity of its source, and may be regarded, therefore, as to some extent wasted. The sound of the whistle, moreover, is diffused equally on all sides. These characteristics to some extent explain the impotency of the sound to penetrate to great distances. Difference in pitch is obtained by altering the distance between the steam orifice and the rim of the drum. When brought close to each other, say within half an inch, the sound produced is very shrill, but it becomes deeper as the space between the rim and the steam or air orifice is increased.

Prof. Henry says the sound of the whistle is distributed horizontally. It is, however, much stronger in the plane containing the lower edge of the bell than on either side of this plane. Thus, if the whistle is standing upright in the ordinary position, its sound is more distinct in a horizontal plane passing through the whistle than above it or below.

The steam fog-whistle is the same instrument ordinarily used on steamboats and locomotives. It is from 6 to 18 inches in diameter, and is operated by steam under a pressure of from 50 to 100 pounds. An engine takes its steam from the same boiler, and by an automatic arrangement shuts off and turns on the steam by opening and closing its valves at determined times. The machinery is simple, the piston-pressure is light, and the engine requires no more skilled attention than does an ordinary station-engine.

"The experiments made by the Trinity House in 1873-'74 seem to show," Price-Edwards says, "that the sound of the most powerful whistle, whether blown by steam or hot air, was generally inferior to the sound yielded by other

instruments," and consequently no steps were taken to extend their use in Great Britain, where several were then in operation. In Canadian waters, however, a better result seems to have been obtained, as the Deputy Minister of Marine and Fisheries, in his annual report for 1872, summarizes the action of the whistles in use there, from which it appears that they have been heard at distances varying with their diameter from 8 to 25 miles.

The result of the experiments made by Prof. Henry and Gen. Duane for the United States Lighthouse Board, reported in 1874, goes to show that the steam-whistle could be heard far enough for practical uses in many positions. Prof. Henry found that he could hear a 6-inch whistle $7\frac{1}{2}$ miles with a feeble opposing wind. Gen. Duane heard the 10-inch whistle at Cape Elizabeth at his house in Portland, Maine, 9 miles distant, whenever it was in operation. He heard it best during a heavy northeast snow-storm, the wind blowing then directly from him, and toward the source of the sound. Gen. Duane also reported that "there are six fog-signals on the coast of Maine; these have frequently been heard at the distance of 20 miles," . . . which distance he gives as the extreme limit of the 12-inch steam-whistle.

Trumpets.—The Daboll trumpet was invented by Mr. C. L. Daboll, of Connecticut, who was experimenting to meet the announced wants of the United States Lighthouse Board. The largest consists of a huge trumpet 17 feet long, with a throat $8\frac{1}{4}$ inches in diameter, and a flaring mouth 38 inches across. In the trumpet is a resonating cavity and a tongue-like steel reed 10 inches long, $2\frac{1}{4}$ inches wide, 1 inch thick at its fixed end, and half that at its free end. Air is condensed in a reservoir and driven through the trumpet by hot air or steam machinery at a pressure of from 15 to 20 pounds, and is capable of making a shriek which can be heard at a great distance for a certain number of seconds each minute, by about one quarter of the power expended in the case of the whistle. In all his experiments against and at right angles and at other angles to the wind, the trumpet stood first and the whistle came next in power. In the trial of the relative power of various instruments made by Gen. Duane in 1874, the 12-inch whistle was reported as exceeding the first-class Daboll trumpet. Beaseley reports that the trumpet has done good work at various British stations, making itself heard from five to ten miles. The engineer in charge of the lighthouses of Canada says: "The expense for repairs, and the frequent stoppages to make these repairs during the four years they continued in use, made them [the trumpets] expensive and unreliable. The frequent stoppages during foggy weather made them sources of danger instead of aids to navigation. The sound of these trumpets has deteriorated during the last year or so." Gen. Duane, reporting as to his experiments in 1881, says: "The Daboll trump-

et, operated by a caloric-engine, should only be employed in exceptional cases, such as at stations where no water can be procured, and where from the proximity of other signals it may be necessary to vary the nature of the sound." Thus it would seem that the Daboll trumpet is an exceptionally fine instrument, producing a sound of great penetration and of sufficient power for ordinary practical use, but that to be kept going it requires skillful management and constant care.

The Siren.—The siren was adapted from the instrument invented by Cagniard de la Tour, by A. and F. Brown, of the New York City Progress Works, under the guidance of Prof. Henry, at the instance and for the use of the United States Lighthouse Establishment, which also adopted it for use as a fog-signal. The siren of the first class consists of a huge trumpet, somewhat of the size and shape used by Daboll, with a wide mouth and a narrow throat, and is sounded by driving compressed air or steam through a disk placed in its throat. In this disk are twelve radial slits; back of the fixed disk is a revolving plate containing as many similar openings. The plate is rotated 2,400 times each minute, and each revolution causes the escape and interruption of twelve jets of air or steam through the openings in the disk and rotating plate. In this way 28,800 vibrations are given during each minute that the machine is operated; and, as the vibrations are taken up by the trumpet, an intense beam of sound is projected from it. The siren is operated under a pressure of 72 pounds of steam, and can be heard, under favorable circumstances, from twenty to thirty miles. "Its density, quality, pitch, and penetration render it dominant over such other noises after all other signal-sounds have succumbed." It is made of various sizes or classes, the number of slits in its throat-disk diminishing with its size. The dimensions given above are those of the largest. (See engraving on page 448, "Annual Cyclopædia" for 1880.)

The experiments made by Gen. Duane with these three machines show that the siren can be, all other things being equal, heard the farthest, the steam-whistle stands next to the siren, and the trumpet comes next to the whistle. The machine which makes the most noise consumes the most fuel. From the average of the tests it appears that the power of the first-class siren, the 12-inch whistle, and first-class Daboll trumpet are thus expressed: siren 9, whistle 7, trumpet 4; and their relative expenditure of fuel thus: siren 9, whistle 8, trumpet 1.

Sound-signals constitute so large a factor in the safety of the navigator that the scientists attached to the lighthouse establishments of the various countries have given much attention to their production and perfection, notably Tyndall in England and Henry in this country. The success of the United States has been such that other countries have sent commissions here

to study our system. That sent by England in 1872, of which Sir Frederick Arrow was chairman, and Captain Webb, R. N., recorder, reported so favorably on it that since then "22 sirens have been placed at the most salient lighthouses on the British coasts, and 16 on light-ships moored in position where a guiding signal is of the greatest service to passing navigation."

The trumpet, siren, and whistle are capable of such arrangement that the length of blast and interval, and the succession of alternation, are such as to identify the location of each, so that the mariner can determine his position by the sounds.

In this country there were in operation in July, 1883, sixty-six fog-signals operated by steam or hot air, and the number is to be increased in answer to the urgent demands of commerce.

Use of Natural Orifices.—There are, in various parts of the world, several sound-signals made by utilizing natural orifices in cliffs through which the waves drive the air with such force and velocity as to produce the sound required. One of the most noted is that on one of the Farallon islands, forty miles off the harbor of San Francisco, which was constructed by Gen. Hartmann Bache, of the United States Engineers, in 1858-'59, and of which the following is his own description:

Advantage was taken of the presence of the working party on the island to make the experiment, long since contemplated, of attaching a whistle as a fog-signal to the orifice of a subterranean passage opening out upon the ocean through which the air is violently driven by the beating of the waves. The first attempt failed, the masonry raised upon the rock to which it was attached being blown up by the great violence of the wind-current. A modified plan with a safety-valve attached was then adopted, which it is hoped will prove permanent. . . . The nature of this work called for 1,000 bricks and four barrels of cement.

Prof. Henry says of this:

On the apex of this hole he erected a chimney which terminated in a tube surmounted by a locomotive-whistle. By this arrangement a loud sound was produced as often as the wave entered the mouth of the indentation. The penetrating power of the sound from this arrangement would not be great if it depended merely on the hydrostatic pressure of the waves, since this under favorable circumstances would not be more than that of a column of water twenty feet high, giving a pressure of about ten pounds to the square inch. The effect, however, of the percussion might add considerably to this, though the latter would be confined in effect to a single instance. In regard to the practical result from this arrangement, which was continued in operation for several years, it was found not to obviate the necessity of producing sounds of greater power. It is, however, founded on an ingenious idea, and may be susceptible of application in other cases.

There is now a first-class siren in duplicate at this place.

The sixty-six steam fog-signals in the waters of the United States have been established at a cost of more than \$500,000, and are maintained at a yearly expense of about \$100,000. The erection of each of these signals was authorized by Congress in an act making special

appropriations for its establishment, and Congress was in each instance moved thereto by the pressure of public opinion, applied usually through the member of Congress representing the particular district in which the signal was to be located. And this pressure was occasioned by the fact that mariners have come to believe that they could be guided by sound as certainly as by sight. The custom of the mariner in coming to this coast from beyond the seas is to run his ship so that on arrival, if after dark, he shall see the proper coast-light in fair weather, and, if in thick weather, that he shall hear the proper fog-signal, and, taking that as a point of departure, to feel his way from the coast-light to the harbor-light, or from the fog-signal on the coast to the fog-signal in the harbor, and thence to his anchorage or his wharf. And the custom of the coaster or the sound-steamer is somewhat similar.

Aberration of Sound.—The fog-signal being found trustworthy in its usual performance, mariners relied on it, and occasionally met disaster. But the failure was, as a rule, ascribed to the signal-keeper rather than to the signal. Still, the complaints set the Lighthouse Board at work to ascertain the cause and, if possible, to provide the remedy. A series of experiments with fog-signals was made by Prof. Henry, beginning in 1865 and continuing till the latter part of 1877. Certain abnormal phenomena were observed relative to the audition of the sound the fog-signals made, and finally examinations were made to ascertain the extent of these aberrations and the cause of them. The aberrations in audibility had not escaped the attention of earlier writers.

The causes assigned for these abnormal phenomena of sound are almost as various as the writers on them. Dr. Derham, writing in 1708, seemed to consider them as caused by variations in temperature, moisture, and wind. Baron von Humboldt, and after him Dr. Dove, Sir John Herschel, and Dr. Robinson, held that aerial flocculence is answerable for these phenomena, a theory adopted and amplified by Dr. Tyndall. Prof. Henry, however, has presented another and different theory, and has worked it out in a series of long-continued and careful experiments, accounts of which are published at length in the reports of the Lighthouse Board and by the Smithsonian Institution in its regular series, and in a separate volume. He reached the conclusion that the wind, when moving at the rate of eight or ten miles an hour, could not act in perceptible retardation of sound when it was moving at the rate of 750 or 780 miles an hour, but he had accepted the idea that it might act by deflection. At this time the suggestion of Prof. Stokes, of Cambridge, England, which offered a plausible explanation of the action of the wind, became known to him, when it "was immediately adopted as a working hypothesis to direct investigation." Prof. Stokes's explanation, which Tyndall speaks of as suggested by some remarkable observations of De la

Roche, roughly stated, is this: "The several strata into which a current of air may be divided do not move with the same velocity. The lowest stratum is retarded by friction against the earth; the one immediately above by friction against the lower; hence the velocity increases from the ground upward." And when the direction of the sound is perpendicular to the sound-wave, as when it is projected against the wind, it will be thrown upward ahead of the observer; and when it is projected with the wind, it will be thrown downward toward the earth. Proceeding on this suggestion of Prof. Stokes, Prof. Henry worked out by careful tests, and gave as the results of his experiments, the causes of the five formulated phenomena, as follows:

1. The audibility of sound at a distance, and its inaudibility nearer the source of sound.

2. The inaudibility of a sound at a given distance in one direction, while a lesser sound is heard at the same distance in another direction.

3. The audibility at one time at a distance of several miles, while at another the sound can not be heard at more than a fifth of the same distance.

4. While the sound is generally heard farther with the wind than against it, in some instances the reverse is the case.

5. The sudden loss of a sound in passing from one locality to another in the same vicinity, the distance from the source of sound being the same.

Prof. Henry explains these abnormal phenomena thus: "The first four of these phenomena find a ready explanation . . . by supposing an increase or diminution in the relative velocity of the currents of wind in the upper or lower strata of air. The fifth is explained by the interposition of an obstacle which casts, as it were, a sound-shadow, disappearing at a given distance by the divergence of the rays on each side of the obstacle into what would be an optical shadow."

Prof. Henry read a paper before the Washington Philosophical Society, Dec. 11, 1872, in which he announced his idea that its cause was due to the deflection of the sound by the action of the wind, an idea which he afterward developed into what he styled a good working hypothesis.

Prof. Tyndall, in May, 1873, began his series of investigations on the subject of the transmission of sound, under the auspices of the Trinity House, of England, in which whistles, trumpets, guns, and the siren were used, the last-named instrument having been lent by the Lighthouse Board of the United States to the Trinity House for the purpose. President Welling makes effective use of these dates in settling the question of precedence as between these authorities.

Among Prof. Henry's last out-givings on this subject, one which, it may be said, occupied much of his attention even in his last illness, were those styled in his last report to the Lighthouse Board "General Conclusions," which may be thus briefly summarized, his own words being used as far as possible:

1. The audibility of sound at a distance—the state

of the atmosphere being constant—depends on the character of the sound.

2. The audibility of sound depends on the state of the atmosphere. A condition most favorable to the transmission of sound is that of perfect stillness, and uniform density and temperature throughout.

3. But the most efficient cause of the loss of audibility is the direct effect produced by the wind. . . . Sound moving with the wind is refracted or thrown down toward the earth; while, moving against the wind, it is refracted upward and passes over the head of the observer.

4. Although, as a general rule, the sound is heard farther when moving with the wind than when moving against it, yet in some instances the sound is heard farthest against the wind, owing to a dominant upper wind blowing at the time in an opposite direction to that at the surface of the earth.

5. Although sound issuing from the mouth of the trumpet is at first concentrated in a given direction, yet it tends to spread so rapidly that, at the distance of three or four miles, it fills the whole space of air inclosed within the circuit of the horizon, and is heard behind the trumpet nearly as well as at an equal distance in front of its mouth.

6. Neither fog, snow, hail, nor rain materially interferes with the transmission of loud sound.

7. In some cases sound-shadows are produced by projecting portions of land, or by buildings situated near the origin of the sound; but these shadows are closed in by the spread of the sound-waves, and thus exhibit the phenomenon of sound being heard at a distance and afterward lost on a nearer approach to the station.

8. It frequently happens on a vessel leaving a station that the sound is suddenly lost at a point in its course, and, after remaining inaudible some time, is heard again at a greater distance, and then is gradually lost as the distance is further increased. This is attributed to the upward refraction of the sound-wave, which passes over the head of the observer, and continues an upward course until it nearly reaches the upper surface of the current wind, when the refraction will be reversed, and the sound sent downward to the earth. Or the effect may be considered as due to a sound-shadow produced by refraction, which is gradually closed in at a distance by the lateral spread of the sound-wave with the earth on either side, in a direction which is not affected by the upper refraction. Another explanation may be found in the probable circumstance of the lower sheet of sound-beams being actually refracted into a serpentine or undulating course.

9. The existence of a remarkable phenomenon has been established, which is exhibited in all states of the atmosphere, during rain, snow, and dense fog, to which has been given the name of aerial echo. It consists of a distinct echo, apparently from a space near the horizon of 15° or 20° in azimuth, directly in the prolongation of the axis of the trumpet. The loudness of this echo depends upon the loudness and quality of the original sound, and therefore it is produced with the greatest distinctness by the siren. It can not be due to the accidental position of a flocculent portion of the atmosphere, nor to the direct reflection from the crests of the waves, as was first supposed, since it is always heard, except when the wind is blowing a hurricane.

As a provisional explanation, the hypothesis has been adopted that, in the natural spread of the waves of sound, some of the waves must take such a curvilinear course as to strike the surface of the water in an opposite direction, and thus be reflected back to the station or location of the origin of the sound.

Prof. Tyndall referred these phenomena, in his book on "Sound," to the existence of acoustic clouds consisting of portions of the atmosphere in a flocculent or mottled condition due to the unequal distribution of heat or moisture,

which, absorbing and reflecting the sound, produced an atmosphere of acoustic opacity.

In the mean time ship-masters were occasionally bringing their ships to grief by placing too much confidence in their hearing of the fog-signals. Complaint would follow against the signal-keeper, who would be charged with having failed on that particular occasion to operate his fog-signal. Thereupon the matter would be investigated by a disinterested person, usually an officer of the navy, and it would generally be made to appear that the fault lay not in the fog-signal, nor in the signal-keeper, but in the audition by the mariner of the blast the fog-signal made.

In fact, these investigations have shown the fallacy of the sailor's idea that sound is always heard in all directions from its source, according to its intensity or force, and according to the distance of the hearer from it; and they have also proved to the sailor, what was before known to the scientific world, that though there may be no lack in the volume of the sound emitted by the fog-signal, there may be a decided lack in the audition of that sound; that it may not be heard at the intensity properly expected; that it may not be heard at all at the place expected; that it may be heard faintly where it ought to be heard loudly; that it may be heard loudly where it should be heard faintly; that it could not be heard at all at some points within easy ear-shot; and then farther away it could be heard better than near by; that it could be heard and lost and heard and lost again within reasonable hearing distance, and all this while the signal was in full blast and sounding continuously.

A *résumé* of certain of these investigations made by disinterested officers of the Government, showing their method and their results, will make these statements more readily comprehended.

On the night of Nov. 6, 1880, the steamer Rhode Island was wrecked on Bonnet Point, at the western entrance to Narragansett Bay, when more than \$1,000,000 was lost. The cause of the disaster was alleged to be the failure of Beaver Tail fog-signal (then a Daboll trumpet) to sound its blast. This signal was on the southern end of Conanicut island, which divides the entrance of Narragansett Bay. The western entrance is but $1\frac{1}{4}$ of a mile wide, with rocky shores. Bonnet Point is but $1\frac{1}{2}$ mile from Beaver Tail. As the fog-signal was generally heard at Newport, five miles distant, and had been heard ten miles away, it seemed almost self-evident that the fog-signal keeper had failed to operate his machine when it could not be heard on a steamer at Bonnet Point, or even when she was in the middle of the channel not a mile away from the signal. But the Lighthouse Board, as usual, caused investigation to precede action. An officer of the navy, detailed to look into the matter, found copious evidence that the fog-signal was in full blast before, after, and during the disaster, and that

it had been heard and acted on by other vessels much farther off than the Rhode Island. Then he took the testimony of the officers and passengers of the ill-fated steamer, and found it certain that they listened for and expected to hear the fog-signal; that they practically did not hear it, and the effect on them was the same as if it had not been operated at all. Thereupon, on Nov. 16, 1880, ten days after the wreck, he set the fog-signal going, though it was on a clear, cold, sunny day, and ran over in a sail-boat the course the Rhode Island had taken, going to the wreck itself, and then ran out of the western channel up by the fog-signal, through the eastern channel, by Castle Hill and Fort Adams, to Newport. The result is shown in Fig. 8, in which the intensity of the sound as heard from the sail-boat is graphically indicated by the width of the track taken by the boat. Where the line is widest, the sound had the most volume; where the line is narrowest, the sound was the least; where the line is broken, the sound could not be heard at all. The wind was moderate, from the west. The observations began at 11.25 A. M. and occupied several hours. The result showed all the aberrations of audition named as possible in the preceding paragraph.

In the summer of 1881, while on a lighthouse steamer, the writer experienced something of the variations in the audition of sound made by the Beaver Tail fog-signal, then a ten-inch steam whistle. When the steamer left the landing at that lighthouse, the fog-signal was to sound for a given time and to begin when the steamer had reached a point about half a mile distant. When that point was reached, we could see from the steam-puffs coming from the stack-pipe that the signal was being blown; but we could not hear it, nor did we, as we continued on our course, running at the rate of six miles an hour, for the next five minutes. When near Whale Rock, slightly less than a mile and a half from the signal, the steamer's paddle-wheels were stopped, silence was ordered fore and aft, and we all listened intently. The expert naval officers thought they heard a trace of the fog-signal, but my untrained ears failed to differentiate it from the moan of the whistling-buoy near Whale Rock. Yet the blast of the ten-inch whistle for which we were listening is often heard ten miles away, with distinctness and certainty.

Soon after I had another opportunity to observe the operations of this signal. We left Narragansett Pier, R. I., on Aug. 6, 1881, at 4 P. M., in a dense fog, with a strong breeze from the west-southwest and a heavy chop sea. We wished to ascertain how far the Beaver Tail fog-signal could be heard dead to windward, and in the heaviest of fogs. At Whale Rock, one and one third mile from it, we did not hear a trace of it; then the steamer was headed directly for Beaver Tail Point, and we ran slowly for it by the compass until the pilot stopped the steamer, declaring we were almost

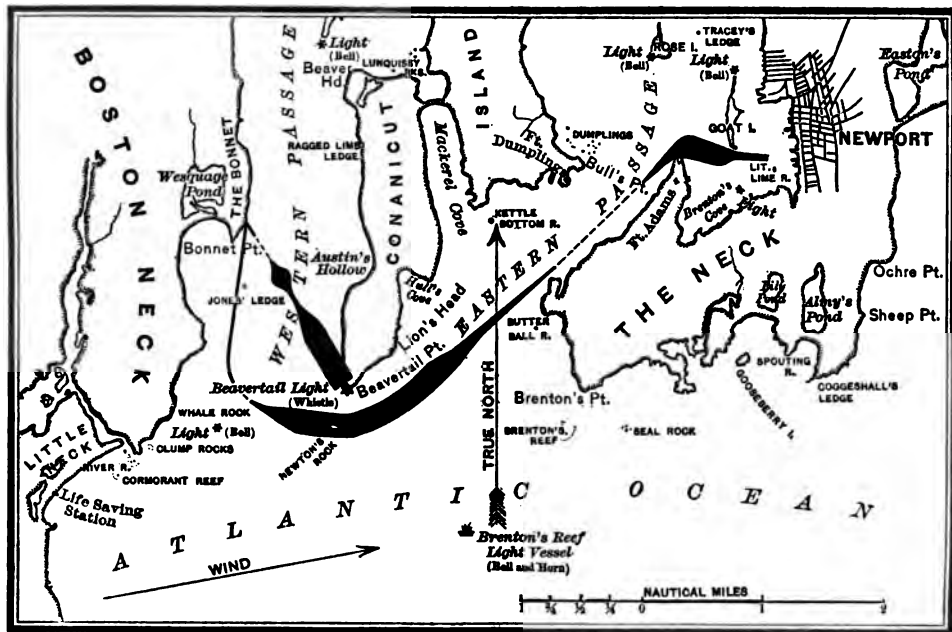

FIG. 3.

This diagram shows the result of observations made by Lieut.-Commander Chadwick, U. S. N., on Beaver Tail fog-signal, Rhode Island, made November 16, 1880, from a sail-boat. Thermometer at beginning, 58° Fahr.; ending, 61°. Wind, moderate, from the west. Weather, clear and cold, with bright sun. Time, beginning at 11.15 A. M.

aboard of the signal itself. Every one strained his ear to hear the signal, but without success; and we had begun to doubt of our position when, the fog lifting slightly, we saw the breakers in altogether too close proximity for comfort. We passed the point as closely as was safe, and when abreast of it and at right angles with the direction of the wind, the fog-signal broke on us suddenly and with its full power. We then ran down the wind to Newport, and had the sound with us all the way. The fog continuing during the next day, the signal kept up its sound, and we heard it distinctly and continuously at our wharf, though five miles distant.

The keeper of the lighthouse at Point Judith has declared that at a particular place between that point and Beaver Tail Point the paddle-strokes of a steamer become inaudible for a moment or two, giving the impression that the vessel has stopped, notwithstanding the fact that they are seen to be revolving and had previously been plainly heard at a longer distance.

On the night of May 12, 1881, about midnight, the Galatea, a propeller of over 1,500 tons burden, with a full load of passengers and freight, bound through Long Island Sound from Providence to New York, grounded in a dead calm and a dense fog on Little Gull island, one eighth of a mile from and behind the fog-signal, and got off two days later without damage. That portion of the island itself which is above water is but a knob, barely large enough to hold a circular platform about one hundred

feet across, on which stand the lighthouse and fog-signal building. Great Gull island, perhaps half a mile from it, is the nearest land. Little Gull island is so surrounded by deep water that vessels can sail around it. It was alleged, as is usual in cases of accident near a fog-signal, that the siren at Little Gull was not in operation at the time of the accident. The signal there was a second-class steam-siren; it was of a similar instrument that Tyndall said in reference to his experiments for Trinity House: "What may with certainty be affirmed is, that in almost all cases the siren may certainly be relied on at a distance of two miles; in the great majority of cases it may be relied on at a distance of three miles; and in the majority of cases at a distance greater than three miles"; and yet the Galatea failed to hear the Little Gull siren, and went ashore about two hundred yards from it, on an under-water prolongation of the island on which the siren was in full blast.

The Lighthouse Board ordered an investigation. This was made by the Assistant Inspector of the Lighthouse District, a naval officer, who reported that after taking the sworn evidence of the light-keepers at Little Gull and the other light-stations within hearing distance, of other government officers who were so located that they might have had knowledge of the facts, and of the officers of vessels that were within ear-shot, including those of the Galatea, he reached the conclusion that the fog-signal was sounding at the time of the accident; and that,

although the fog-signal was heard at Mystic, fifteen miles distant in another direction, and although it was heard on a steam-tug a mile beyond the Galatea, it was heard faintly, if at all, on that vessel; and if heard at all, was so heard as to be misleading, though the Galatea was but one eighth of a mile from the source of the sound.

It appears that this officer spent several days steaming around Little Gull, while the fog-

each case the condition of the atmosphere as to humidity, pressure, temperature, and motion are shown, as is also the tidal condition.

On August 3d the writer had an opportunity to hear this fog-signal and to note its audibility. The wind was from the south and very light; the air was damp, smoky, hazy, and, as the sailors say, hung low; the barometer stood at 29.90; the tide was about flood. Our steamer was run for six miles in the axis of the siren's trumpet, which was sounded for our benefit at its full force. Note was made every third minute in a scale of ten of the intensity of the sound, and it was found that the addition decreased normally with the distance for the first two miles; at 2½ miles it had fallen off one half; at 3 miles it had fallen off to one tenth of its power; at 3½ miles away we could hear but a faint murmur, and, when 4 miles distant, we had lost it completely; and yet there seemed to be no reason why we should not have heard it clearly at three times that distance.

The next morning was calm, but heavy with white fog; yet we heard the Little Gull siren distinctly, though it was 10½ miles off, as we lay at our wharf in New London. The steamer ran out of the harbor, but was compelled to anchor, so thick was the fog; yet we heard Little Gull, though 7½ miles off, at a force of six in the scale of ten, and the sound was so distinct that we could differentiate it from the siren at the New London light, which was much nearer to us. The steamer worked round to inspect the neighboring lights, and we heard the Little Gull siren when at North Dumpling light station, 7 miles off, at a force of six; at Morgan's Point Light, 10 miles off, at a force of five; and we continued to hear it at an intensity of from five to six as we worked around among the other lights, within a compass of 10 miles, till the fog broke and the siren ceased.

Opportunity soon occurred for making more critical experiments. On a fine day we ran out to Little Gull, had the siren started under full steam, and then, following out a pre-arranged programme, ran around Little Gull island in such way as to describe a rectangle of about eight by ten miles, its longest side running nearly north and south. No fixed rate of speed was maintained, but the steamer slowed, backed, or stopped, as was necessary. The atmosphere was what the sailors call lumpy, and Prof. Tyndall calls non-homogeneous. Prof. Henry, when writing of a like condition, said, "As the heat of the sun increases during the first part of the day, the temperature of the land rises above that of the sea, and this excess of the temperature produces upward currents of air, disturbing the general flow of wind, both at the surface of the sea and at an elevation above." Observations were made and noted in a scale of ten, of the force or intensity of the signal's sound as it reached us at the end of each minute. The diagram, Fig. 6, shows a sufficient number of the results for our pur-

poses, taken from the tabulated schedule of our notes.

At 4 p. m. two of us went in a row-boat to Little Gull, from the steamer which lay at anchor half a mile off, and verified the fact that the fog-signal had been in full operation during the time of our observations. It then occurred to us to investigate still more closely what appeared to be a space, a circle of silence, in which, during the experiments of the morning, we had failed to hear the signal. After having had the siren put in full operation again, we pulled toward the nearer end of Great Gull island, the siren sounding meantime with ear-splitting force. When about 600 yards away, we suddenly lost the sound as completely as if the signal had stopped. Pulling toward the steamer, not more than 200 yards, we reached a position at right angles with the axis of the siren's trumpet, when we suddenly heard the sound again at its full force. Thus, in pulling

500 yards, we passed from complete audition of the signal to absolute inaudition; and then we passed back again to complete audition by pulling 200 yards in another direction. All this took place within half an hour, in open water, always in full view of the signal-station, and without any visible obstacle being interposed or removed. While on the island we learned that one of the light house keepers, who had been on leave, had just returned from Sag Harbor, twenty miles to the southeast. He had failed to hear the signal at all, until opposite the eastern end of Great Gull island, and until he was within half a mile of the siren, which was in full operation.

The next morning our steamer anchored about a mile north of Little Gull; the wind was light, the air was clear, and the day was warm and beautiful. As it had been preceded by a warm night, the atmosphere was homogeneous, and it was expected that we should

have a day of normal audition and barren of curious phenomena. After the siren had begun its noise, we ran down to a point within half a mile of the lighthouse, and then steamed for Plum island, running a little south of east for six miles, when we returned as nearly as might be on our own track. The results were curious. We lost half the force of the sound when within a quarter of a mile of the siren; a moment later we had lost four fifths of it. Running another half-mile, we were off the middle of Great Gull island, and the sound had increased to a force of four; in five minutes more it had dropped to three; from that time, till we reached the end of our six-mile run, it gradually weakened, and it had dropped to a force of two when we turned and ran back to our anchorage. It is especially curious that the sound had the same intensity at three sixteenths of a mile from its source, and at six whole miles from that point, while it varied from two to ten in a scale of ten between those points. The results of the trip are more fully and exactly given in the diagram, Fig. 7.

FIG. 7.

This diagram shows the result of observations at Little Gull Island, Long Island Sound, Aug. 10, 1881, beginning at 10.30 A. M. Thermometer, dry bulb, 76°; wet bulb, 75° F. Barometer, 29.40. Wind W. by N., force 3, and steady throughout. Day clear and beautiful.

Thinking that possibly this peculiarity might have been induced by those differences of temperature in the strata of the atmosphere suggested by Tyndall as probable cause for such phenomena, effort was made to ascertain something of these differences by sending a thermometer to the upper air. In the course of the afternoon we made a kite six feet high, attached to it a self-registering thermometer, and after several trials succeeded in getting it up about 500 feet, and in hauling it safely in again after it had been up over an hour. The thermometer had a wet bulb, and was protected from the direct rays of the sun; but it registered only half a degree more of heat at its highest point than it had registered in the pilot-house. The course the kite took showed

NOTE.—Figs. 4, 5, 6, and 7, were prepared from diagrams made and sent the writer by the eminent chief of the French Lighthouse Service, Emile Allard, Inspecteur-Général des Ponts et Chaussées, Directeur du Service Central des Phares et Balises. M. Allard made them from the diagrams in the writer's paper on the "Aberrations of Audibility of Fog-Signals," in which the intensity of sound at each point was indicated by Arabic numerals in a scale of ten. The writer submits Allard's diagrams, because they convey the desired meaning better than do his own diagrams.

no difference between the air-currents aloft and aloft.

The result of these and other observations was laid before the Washington Philosophical Society on Oct. 22, 1881, and then, and at a subsequent meeting, was made the subject of some discussion, an account of which appeared in its publications, and was published in pamphlet form.*

M. Allard, Director of the French Lighthouse Service, in his "Mémoire sur la Portée des Sons et sur les Caractères à attribuer aux Signaux sonores," recently published by his Government, records some curious experiments with various fog-signals made in France, Germany, and England, as well as in this country. He has compared, in tabular form, the results of these experiments, and gives the range of sound of each instrument under a variety of conditions, taking into consideration the intensity and pitch of the sound, the direction and force of the wind, and its angle of action on the phonic beam. He has established a mathematical formula for the calculation of the range of the sound of each instrument, under certain given circumstances, in which he expresses what he styles the acoustic transparency of the atmosphere by a coefficient, and he has also expressed graphically the set of results obtained, thus assisting largely the intelligent discussion of the general subject.

Tillamook Light and Fog-Signal Station is on an isolated rock about half a mile west of the coast of Oregon, and about 20 miles south of the mouth of Columbia river. The signal is a steam-siren. The surface of the rock is about 86 feet above the water, and the trumpet, which points almost westward, has an elevation of fully 100 feet. (See engraving on page 443, "Annual Cyclopaedia" for 1880.) Col. Gillespie, of the Corps of Engineers, U. S. A., who built the tower and put in the illuminating and fog-signal apparatus, tested the latter, steaming to the west directly from it on a clear bright day, and found that the sound became practically inaudible at a distance of two miles. In a letter dated Nov. 6, 1882, he wrote:

My first attention was called to the defects of audibility by the captain of the Shubrick, who stated, in May, 1881, that, when anchored in a small bight south of the rock near Arch Rock, and about one mile distant, he could hear the sound but faintly. On my next visit I directed the engineer to get up steam, and when he had a pressure of fifty pounds, to whistle, and then set the machinery in motion. On receiving the signal, I made a circuit of the rock and then proceeded westward under slow bell, recording my distance by interval of sound at each blast. At two miles the sound became quite weak, and at the next blast no sound was received. Our engine was not stopped when receiving the sound, and my station was aft quite near the propeller; the day was bright and clear, without any wind. The temperature was 65° or thereabout; don't know the barometer reading. On receiving the next sound the boat was at rest, that is,

* Aberrations of Audibility of Fog-Signals. By Arnold B. Johnson, Chief Clerk of the Lighthouse Board. Washington, 1882.

just as soon as the puff was noticed the engine was stopped, and we waited for the sound. A very faint sound was noticed up to four miles, and beyond that nothing was heard.

I was then on the point of returning to the rock to examine the machinery personally, when it struck me that I ought to go out to the estimated limit of the range. On resuming our course, nothing was heard until we were out seven miles approximately, when the sound became audible again—a clear, resonant sound, but low-toned. We carried this characteristic sound for another four miles, when it likewise disappeared. The engineer afterward told me that he carried at least sixty pounds of steam. It was growing late, and as the sea and rising winds gave promise of a squall, we hurried back to get inside of the bar. . . . The sea-captains on the iron vessels plying to San Francisco reported later that they were able to hear the sound at a distance of eight miles. . . . My impression is that the cliffs of the east side are too far distant to affect the sound one way or the other. I have never heard an echo there, and I believe that the distance is too great to have the noise of the surf upon the rocky beach deaden the sound seaward of the station.

The ends of the trumpet are bent toward the horizon, terminating in bell-shaped lips. The sound is propagated therefrom in a horizontal plane, and previous experiments have shown that the sound produced is as strong as if the whole trumpet lay horizontally.

This is quoted as showing that the sound, which on one occasion intermitted at two miles from its source, was heard faintly at four miles, and then again distinctly at seven miles, and was carried out to eleven miles, when the steamer turned back without ascertaining how much farther the sound might be carried. This is deemed a peculiar and important instance, as there was practically no land or other thing in front of the source of sound, unless it be an opaque cloud from which the sound could rebound, or which could cast a sound-shadow for hundreds of miles.

Some curious experiments have taken place off Whitehead Light and Fog-Signal Station, which is in the Atlantic on a small island about one and a half mile from the coast of Maine. The fog-signal is on the southeastern slope of the rock, and about seventy-five feet above mean tide. The phenomena observed by Prof. Henry consisted in great variation of intensity of sound while approaching and receding from the station. One instance occurred during a thick night-fog in 1872, when, approaching the station in the steamer *City of Richmond* at a distance of six miles, the fog-signal, a ten-inch steam-whistle, was distinctly heard and continued to be heard with increasing intensity until within three miles, when the sound suddenly ceased to be heard, and was not heard again until the steamer was within a quarter of a mile of the station, though it was known that the signal had been sounding during the whole time. The wind was from the south, or almost opposed to the sound, but during the whole of this time the fog-signal keeper could hear the sound of the steamer's six-inch whistle.

Commander H. F. Picking, U. S. N., then inspector of the First Lighthouse District, having

frequently received complaints from ship-masters that they lost the sound of the Whitehead fog-signal, determined to ascertain the facts by personal investigation, and in July, 1877, approached Whitehead from the southeast during a fog. He reports that he heard the sound distinctly from six to four miles, then lost it, and could hear nothing until within a quarter of a mile of the island, when the blast of the whistle burst forth in full sound. The wind was then against the sound.

Previously, Gen. Duane, of the Corps of Engineers, U. S. A., then engineer of that lighthouse district, reported that, approaching the signal from the southwest, he heard the sound at about six miles' distance, then lost it, and did not hear it again until within about a quarter of a mile. The wind was then also against the sound.

On Sept. 4, 1877, Prof. Henry made further experiments at Whitehead. The weather was clear, the wind west-southwest, with a velocity of from ten to twelve miles, remaining nearly constant during the day. The barometer stood at 28.9; the thermometer at 67° Fahr. in the open air, and about 57° in the water. As they steamed from the station directly to windward, the sound slightly diminished. When they were between a quarter and a half mile distant, they lost the sound completely, and it continued inaudible for about a mile, when it was faintly heard, and continued to increase in loudness until they were four miles off, when it was heard with clearness, but on going on it diminished gradually. They then went back over their course, and observed the phenomena in the reverse order. Experiments tried on three other days showed curious results, which differed somewhat from those previously made, of which a full report is given in the "Annual Report of the Lighthouse Board for 1877," together with Prof. Henry's views as to the cause of each observed phenomenon. A full account of the matter is also given in the book entitled "Henry on Sound."

Col. C. E. Blunt, Corps of Engineers, U. S. A., then engineer of the First Lighthouse District, was also at a later date struck by the peculiarity in the audition of the sound from this signal. Writing from Portland, Maine, on Sept. 28, 1882, he said:

The peculiarities of Whitehead whistle have already been noted. Quite recently I have myself noted one of them. Leaving there for Portland, in the *Myrtle*, early on the morning of the 2d instant, the whistle having been blown during fog part of the previous night for the first time, with its new characteristics (4-second blast and 26-second interval), the keeper kept it going for a short time after the weather had cleared, as I wished to test it. It was bright sunshine, with the light air from the southeast, I think. Leaving the Head, the whistle was plainly heard for two or three miles; when, still in plain sight, the sound began to grow fainter, and at length was quite inaudible, though it was plainly blowing. In a few minutes the sound was again faintly heard, and, increasing in volume, soon came out in full force, and so continued. It was clearly deflected upward, and then downward, as I imagined, thus:

FIG. 2.—BLUNT'S DIAGRAM.

With regard to snow, it is thought by seamen in this vicinity that it is favorable to sound; certainly, Portland Head trumpet is very distinctly heard here during violent northeast snow-storms, when it is directly to the leeward.

Prof. Henry made observations at a number of light-stations for various purposes connected with the investigation of the laws of sound, from his report of which it appears that he noted a number of instances of remarkable aberrations of audition of several fog-signals. These are recorded at length in "Henry on Sound," in the reports of the Lighthouse Board of 1874-'75, and in the reports of the Smithsonian Institution for several years.

The experiments were not confined to our own shores. Prof. Tyndall, who stood in the same relations with the British Lighthouse Establishment that Prof. Henry did to our own, reported thus:

With a view to the protection of life and property at sea in the years 1873-'74, this subject received an exhaustive examination, observational and experimental. The investigations were conducted at the expense of the Government, and under the auspices of the Trinity House. The most conflicting results were at first obtained. On the 19th of May, 1873, the sound-range was 8½ miles; on the 20th it was 5½ miles; on the 2d of June, 6 miles; on the 3d, more than 9 miles; on the 10th, 9 miles; on the 25th, 6 miles; on the 26th, 9½ miles; on the 1st of July, 12½ miles; on the 2d, 4 miles; while on the 3d, with a clear, calm atmosphere and smooth sea, it was less than 3 miles.

From the letters received from officers of the navy and of the merchant marine service, also from officers of the English, Scotch, and French lighthouse establishments, it is evident that public attention is being given to the subject, and that observations are being made as to such aberrations simultaneously in various parts of the world.

Dr. Welling, President of Columbian University, in a paper read before the Washington Philosophical Society, Nov. 5, 1881, said:

In a paper presented to the Royal Society in 1874, Prof. Reynolds showed that the form of the sound-wave is liable to flexure from changes in the temperature of the atmosphere, as well as from the unequal motion of the wind. These abnormal phenomena of sound, considered in connection with the hypothesis of Prof. Stokes, as enlarged and applied by Prof. Henry, may be reduced in the following generalizations, which, if accurate in point of logical form, and true in point of the facts to which they are applied, may be stated under the guise of aphorisms, as follows:

1. Where the condition of the air is nearest that of a calm, the larger will be the curve of audition, and

the nearer will the shape of the curve approach to a circle, to which the point of origin of the sound, or the point of perception, will be the center. (This aphorism is stated abstractly from any consideration of temperature-refraction which, so far as it exists, will always tend to modify the shape of the curve of audition.)

2. Apart from all consideration of temperature-refraction, a sound will be heard farthest in the direction of a gentle wind, because the portion of the sound-wave thrown down from above, in this case, is re-enforced by the sound reflected from the surface, and will thus more than compensate for the loss by friction.

3. Other things being equal, the area of audition will be proportionately diminished in the case of sounds moving against winds more or less strong, because the sonorous waves will be refracted above the ears of the observer.

4. The area of audition will be diminished in the case of a sound moving with an over-strong favoring wind, because the sound-waves in this case will be so rapidly and strongly thrown to the ground that the intensity of the sound will suffer more diminution from absorption and friction than can be supplied by the upward reflection of the sound-rays conspiring with the gradual downward flexure of the sound-waves, as in the case of a gentle favoring wind.

5. Sounds moving against a gentle wind will, *ceteris paribus*, be heard farther than similar sounds moving with an over-strong favoring wind, for reasons already implied, because the downward flexure of the sound-waves, being excessive in the latter case, tends to extinguish the conditions of audibility more rapidly than is done by the slight upward refraction in the former case.

6. When sounds moving against the wind are heard farther than similar sounds moving with a wind of equal strength, it is because of a dominant upper wind blowing at the time in a direction opposite to that at the surface.

7. A sound moving against the wind, and so refracted as in the end to be thrown above the head of the observer, will, at the point of its elevation, leave an acoustic shadow. But this acoustic shadow, at a still further stage, may be filled in by the lateral spread of the sound-waves, or may be extinguished by the downward flexure of the sound-waves, resulting from an upper current of wind moving in an opposite direction to that at the surface, or resulting in a less degree from an upper stratum of still air. Under these circumstances, there will be areas of silence inclosed within areas of audition.

8. As sounds may be refracted either by wind, or by changing temperatures, or by both combined, it follows that, under many circumstances, a sound lost at one elevation may be regained at a higher elevation.

9. As sounds moving against the wind are liable to become inaudible (by being tilted over the head of the observer), even before their intensity has been extinguished, we may find in this fact an explanation of the statement made by Reynolds, that "on all occasions the effect of wind seems to be rather against distance than distinctness."

10. As sounds may be inaudible at certain distances and elevations without being wholly extinguished, it follows that the comparative inaudibility of sounds at different times can not always be cited as an evidence of their relative intensities. The comparative inaudibility may be a function of variable refraction, rather than of variable intensity. Hence the law of inverse squares, though perfectly true in its theoretical application to the measurement of the intensity of all sounds, can not always be legitimately used to calculate backward from the audibility of a sound, as empirically ascertained at a given point and elevation, to its relative intensity as previously heard at the same point and elevation.

11. The hypothesis of Stokes, as applied by Henry, does not exclude the hypothesis of Humboldt, but reduces the latter to a very subordinate and inappreciable place in interpreting the abnormal phenomena of sound.

12. The hypothesis of Stokes, as applied by Henry, does not exclude the reasoning or the experimental proofs by which Prof. Reynolds demonstrates that differences in temperature exert a refracting power in sound, but finds in that refraction an influence which may sometimes accelerate and sometimes retard the refraction produced by wind.

The officer who made the reports as to the fog-signals at Beaver Tail and Little Gull, after the accidents to the steamers Rhode Island and Galatea heretofore mentioned, was then Assistant-Inspector of the Third Lighthouse District, Lieut.-Commander F. E. Chadwick, U. S. N.; and it was he who had charge of the lighthouse steamer while the foregoing observations were being made, after Capt. George Brown, U. S. N., the inspector, was called elsewhere. In answer to certain questions as to the opinions which had forced themselves upon him, he said:

It seems to me that navigators should understand that, when attempting to pick up a fog-signal, attention must be given to the direction of the wind, and that if they are to windward (in a moderate breeze) the chances are very largely against hearing it, unless close to: that there is nearly always a sector of about 120° to windward of the signal, in which it either can not be heard at all, or in which it is but faintly heard. Thus, with the wind east-southeast, so long as they are bearing from the signal between northeast and south, there is a large chance that the signal will not be audible until it is very close.

As they bring the signal to bear at right angles with the wind, the sound will almost certainly, in the case of light wind, increase, and it will soon assume its normal volume—being heard almost without fail in the leeward semicircle.

Fog, to my mind, and so far as my experience goes, is not a factor of any consequence whatever in the question of sound. Signals may be heard at great distances through the densest fogs, which may be totally inaudible in the same directions and at the same distances in the clearest atmosphere. It is not meant by this last statement that the fog may assist the sound, as at another time the signal may be absolutely inaudible in a fog of like density, where it had before been clearly heard. That fog has no great effect, can easily be understood when it is known, as it certainly is known by observers, that even snow does not deaden sound, there being no condition of the atmosphere so favorable for the far-reaching of sound-signals as is that of a heavy northeast snow-storm, due, supposedly, to the homogeneity produced by the falling snow.

It seems to be well established by numerous observations that on our own northern Atlantic coasts the best possible circumstances for hearing a fog-signal are in a northeast snow-storm, and, so far as these observations have extended, they seem to point to the extra-

ordinary conclusion that they are best heard with the observer to windward of the signal; and that in light winds the signal is best heard down the wind, or at right angles with the wind.

The worst conditions for hearing sound seem to be found in the atmosphere of a clear, frosty morning on which a warm sun has been shining for two or three hours.

The curve of audibility in a light or moderate breeze, in general, is similar to that plotted by Prof. Henry, as in the accompanying diagram.

FIG. 9.—THE HENRY DIAGRAM.

I think it is established that there are two great causes for these phenomena: non-homogeneity of the atmosphere, and the movement of the wind. How this latter acts, no one can say. The theory of retardation of the lower strata of the atmosphere near the earth's surface, as advanced by Prof. Stokes, of England, seems good for moderate winds, but it hardly holds in cases where the siren is heard from eighteen to twenty miles to windward during northeastern gales.

While the mariner may easily expect to hear the sound of the average fog-signal normally as to force and place, he should be prepared for occasional aberrations in audition. It is impossible, at this point in the investigations, which are still in progress, to say when, where, or how the phenomena will occur. But certain suggestions present themselves even now as worthy of consideration.

It seems that the mariner, in order to pick up the sound of the fog-signal most quickly, should, when approaching it from the windward, go aloft; and that when approaching it from the leeward, the nearer he can get to the surface of the water the sooner he will hear the sound.

It also appears that there are some things the mariner should not do. He should place no negative dependence on fog-signals; that is, he should not assume that he is out of hearing distance because he fails to hear the sound. He should not assume that, because he hears a fog-signal faintly, he is at a great distance from it. Neither should he assume that he is near it because he hears the sound plainly. He should not assume that he has reached a given point on his course because he hears the fog-signal with the same intensity that he did when formerly at that point. Neither should he assume that he has not reached this point because he fails to hear the fog-signal as loudly as before, or because he does not hear it at all.

He should not assume that the fog-signal has ceased sounding, because he fails to hear it even when within easy ear-shot. He should not assume that the aberrations of audibility which pertain to any one fog-signal pertain to any other fog-signal. He should not expect to hear

a fog-signal as well when the upper and lower currents of air run in different directions; that is, when his upper sails fill and his lower sails flap, or when his lower sails fill and his upper sails flap. He should not expect to hear the fog-signal so well when between him and it is a swiftly-flowing stream, especially when the tide and wind run in opposite directions. He should not expect to hear it well during a time of electric disturbance. He should not expect to hear a fog-signal well when the sound must reach him over land, as over a point or an island. And when there is a bluff behind the fog-signal he should be prepared for a regular interval in audition, such as might be produced could the sound ricochet from the trumpet as a ball may go from a cannon; that is, he might hear it two, four, six, eight, and ten miles from the signal, and lose it at one, three, five, seven, nine, and eleven miles, or at any other combination of distances, regular or irregular.

These deductions, some made by the first physicists of the age, and some drawn from the original investigations here noted, are submitted for consideration, rather than given as directions. They are assumed as good working hypotheses for use in further investigations. While it is claimed that they are correct as to the localities in which they were made, it seems proper to say that they have not been disproved by the practical mariners who have given them some personal consideration, and who have tried to carry them into general application. If Prof. Tyndall's finely phrased assertion that "we know both the reason and the range of their variations" may be taken as a prediction, the time may then come when the variations of audition may be corrected as we now correct the variations of the mariner's compass. Until then, it will be well for the mariner, when he does not get the expected sound of the fog-signal, or when he does not get it as his sailing directions teach him to expect it, to assume that he may not hear the warning that has been faithfully given, and then to heave his lead and resort to the other means used by the careful navigator to verify his position.

Bibliography.—The following authorities were consulted in the preparation of this paper:

"Documents relating to Lighthouses," vol. i; "Annual Reports of the Lighthouse Board"; Parliamentary Papers, 1864; Stevenson's "Lighthouse Illumination"; Tyndall on "Sound"; "Transactions of the Royal Scottish Society of Arts," vol. vi; "Coast Fog-Signals," a lecture at the Royal United Service Institution, by Alexander Beazeley; "Signaling by means of Sound," a lecture by E. Price Edwards; "Philosophical Society's Transactions," vol. xxvi; "Annales de Chimie et de Physique," tome xiii, and 1816, vol. i; "Wirkungen aus der Ferne"; "Encyclopædia Metropolitana"; Smithsonian Reports and Miscellaneous Collections; Henry on "Sound"; "Proceedings of the British Association," 1857; "Washington Philosophical Society's Transactions," vol. v; Dublin "Philosophical Magazine," vol. i; "American Journal of Sciences," third series, vol. xi; "Reports of the British Association," xxiv, second part; "Phares Electriques et les Signaux Sonores," par M.M. Sautter et Lomonnier; "Mémoire

sur la Portée des Sons et sur les Caractères à attribuer aux Signaux Sonores," by Emile Allard.

SOUTH CAROLINA. State Government.—The following were the State officers during the year: For Governor, Hugh S. Thompson, Democrat; Lieutenant-Governor, John O. Sheppard; Secretary of State, James N. Lipscomb; Treasurer, J. P. Richardson; Comptroller-General, W. E. Stoney; Attorney-General, C. R. Miles; Superintendent of Public Instruction, Asbury Coward; Commissioner of Lands, A. P. Butler. Judiciary, Supreme Court: Chief-Justice, W. D. Simpson; Associate Justices, Henry McIver and Samuel McGowan. Railroad Commissioners, M. L. Bonham, L. J. Walker, and D. P. Duncan.

Legislative Session.—The Legislature convened on November 27th and adjourned December 23d. Among the acts that became laws are the following:

To limit the ages of pupils attending the free public schools.

To prohibit the sale of unsound meat.

To amend the law in regard to the registration of electors.

Providing the manner in which joint debtors may separately compound their indebtedness.

In relation to bonds heretofore executed, or which may hereafter be executed, to secure the payment of the phosphate royalty to the State.

To prevent the netting and trapping of partridges except by persons upon their own lands.

To require foreign co-operation assessment companies to comply with the insurance laws of the State, and to clearly define who shall be considered agents of insurance companies.

To declare the persons occupying offices in railroad stations agents of the corporations.

To declare void contracts for the sale of articles for future delivery made under certain circumstances.

To declare the law in reference to the liability of stockholders in corporations.

To secure the rights of persons having an interest in lands forfeited for taxes.

The supply bill levies a State tax of 5 mills, exclusive of the school-tax, for the support of the government for the fiscal year beginning Nov. 1, 1883. A tax for county purposes, of varying rate, is levied in each county. The Governor and Treasurer are authorized to borrow as much money as needed to meet the interest on the bonds, provided the amount shall not exceed \$200,000.

An important act was that amending the railroad law. All those sections of the late law giving the commission power to fix rates are repealed. The railroads are to submit their rates to the commission for approval or modification before putting them into effect. If the commission approve, they go into effect almost immediately. If the commission disapprove and modify after hearing argument from the roads, and the roads will not accept the commission's modification, they have the right to appeal to the Circuit Judge of Richland county, or in his absence to some other Circuit Judge selected by the Chief Justice. The evidence taken before the commission is submitted to him, and he must decide the case within ten days, his decision to be final. The rates to be submitted to the commission by the roads include through and joint rates. The sections against discrimination remain in the law.

An act was passed for the organization of boards of health, and for the protection of the public health.

A constitutional amendment, to be submitted to the people in November, 1884, was adopted, which proposes to limit the amount of indebtedness that may

Vertical text on the left margin, likely bleed-through from the reverse side of the page. The text is extremely faint and difficult to decipher, but appears to contain several lines of characters.

G. J. ...

be contracted by the several counties to 8 per cent. of the assessed taxable value.

Finances.—At the date of the last report the debt of the State was \$6,571,825. During the past fiscal year a few bonds were issued under special acts, and the sinking-fund commission purchased and canceled \$41,207.67 of deficiency bonds, thus reducing the amount of the debt to \$6,531,290.68. The Comptroller-General reports that very little progress has been made in funding the old bonds under the act of 1873 and its amendments. He estimates that it will require \$348,235 to meet the ordinary expenses of the government during the fiscal year 1883-'84. To this amount must be added \$391,878 for interest on the public debt, making \$740,113. The proceeds of the phosphate royalty and the probable surplus in the treasury, estimated at \$197,251, will reduce the amount to \$542,862, which can be raised by a levy of four mills.

The amount of property returned for taxation in 1882 was \$145,442,292. The amount returned for 1883 is:

Real estate	\$87,181,401
Personal property	49,249,889
Railroad property	15,227,964

Total \$150,660,904

This is an increase in one year of \$5,167,012.

The reports of the Secretary of State show each year a large increase in the amount of land held nominally by the commissioners of the sinking fund for non-payment of taxes.

Education.—There were enrolled in the public schools during the year, 74,157 white and 98,938 colored pupils, making a total of 173,095. This is an increase of 27,121 over the large enrollment for the preceding year. From a comparison of this enrollment with the data furnished by the census of 1880, it appears that over 73 per cent. of the white children, and nearly 55 per cent. of the colored children of the State, between the ages of six and sixteen years, were in attendance on the public schools. The average length of the school session was four months. The number of teachers employed was 8,494, of whom 2,165 were white and 1,329 were colored; number of schools in operation was 3,269, an increase of 86.

Clafin College, at Orangeburg, was founded in 1869, and is designed for the higher education of colored youths of both sexes. Since 1879 thirty have been graduated. Attached to the institution is a farm of 150 acres, which is cultivated chiefly by the labor of the students. A mechanical department has been added. The enrollment of students for the last year was 424, of whom 80 were in the collegiate department and 11 in the normal school.

The Military Academy had an enrollment on the 1st of October last of 155; of this number, 68, being two from each county, are maintained by the State. The beneficiary cadets are chosen by competitive examinations.

The South Carolina College is now thoroughly reorganized. Its buildings have been

repaired, its grounds improved, and its several departments fairly equipped. Its teaching force consists of a president, seven professors, and three tutors. Arrangements have been made for post-graduate instruction. The catalogue of last year shows a total enrollment of 185.

State Institutions.—The Institution for the Education of the Deaf and Dumb and the Blind has 72 pupils, an increase of 10 in a year. A department for the colored has been established.

The number of patients in the Lunatic Asylum at the beginning of the last fiscal year was 550; the number admitted during the year was 239. At the close of the year the number was 603, of which 352 were white and 251 colored. The annual increase in the number of patients is from 50 to 60. The General Assembly has provided for the erection of an additional building at a cost not to exceed \$50,000. It will be finished Oct. 1, 1884.

The number of convicts in the Penitentiary, Oct. 31, 1883, was 886, an increase of 72 in a year; 55 were white, and 841 colored. The convicts are employed under lease, or on public works, and are a source of revenue to the State. If all were returned to the prison, the cell-room would be greatly insufficient.

Miscellaneous.—The uncertainties and disasters attending the cultivation of rice, since 1860, have reduced the average crop of twenty-five years since, which was 120,000 to 150,000 tierces, to about 40,000 or 45,000 tierces. The planting now is restricted to such places as have escaped the action of time and war.

There are in the State 26 cotton-factories, which are either in full operation or expect to be within a very short time.

Toward the close of the year several persons were brought to trial in the United States Court, charged with violation of the congressional election acts. The juries, however, failed to convict.

SPAIN, a kingdom of southern Europe.

Government.—The reigning sovereign, Alfonso XII (son of the ex-Queen Isabel II), was born Nov. 28, 1857; proclaimed King of Spain at Madrid, Dec. 31, 1874; assumed the government Jan. 9, 1875; married, Jan. 23, 1878, Princess Maria de las Mercedes (youngest daughter of the Duke de Montpensier, who was born June 24, 1860, and died June 26, 1878; married, Nov. 29, 1879, the Archduchess Maria Christina of Austria (daughter of the late Archduke Charles Ferdinand of Austria), born July 21, 1858. Two daughters have been born of the second union.

By the terms of the Constitution of June 30, 1876, the executive power is vested in the King, and the legislative power in the Cortes "with the King." The King is inviolable, but his ministers are responsible, and by one of these all royal decrees must be countersigned. The King can not contract matrimony without the approval of the Cortes, nor can he marry any one excluded by law from the succession to the throne. In the event of the extinction of the

line of the legitimate descendants of Alfonso XII, the following order of succession shall be observed: first, his sisters; next, his aunt (the Infanta Luisa, second daughter of King Ferdinand VII), and her legitimate descendants; and, finally, his uncles (the brothers of Ferdinand VII). Should all the lines become extinct, "the nation will elect its monarch."

The Cortes is composed of a Senate and a Chamber of Deputies, equal in authority. The senators are of three classes: Senators "by their own right"; life-senators appointed by the Crown; and senators elected by the corporations of the state and by the largest taxpayers. Senators "by their own right" are the sons of the sovereign and of the heir-apparent to the Crown, who have attained their majority; grandees of Spain in their own right and having an annual income of not less than 60,000 pesetas (\$12,000); captain-generals in the army; admirals; the Patriarch of the Indies and the archbishops; the presidents of the Council of State, of the Supreme Court, and of the Tribunal de Cuentas del reino. The number of senators of the first two classes together and of the third class cannot exceed 180. The elective senators must be renewed in one half every five years, and completely whenever the King dissolves that portion of the legislative bodies. The Chamber of Deputies is composed of members chosen for five years by the electoral colleges, in the proportion of one to every 50,000 inhabitants. A royal decree of Aug. 8, 1878, grants to Cuba the privilege of sending deputies to the Cortes in the proportion of one to every 40,000 free inhabitants paying taxes to the amount of not less than 125 pesetas (\$25) annually. Deputies must be at least twenty-five years of age, and may be re-elected indefinitely. A deputy can not without resigning accept a pension, an office under the Government or in the royal household, or a decoration. Ministers are exempt from this law. Both houses sit every year. The King has the power to convolve, suspend, or dissolve them; but in the last case a new Cortes must meet within three months. The president and vice-president of the Senate are appointed by the Crown from among the senators only.

The Council of Ministers of Jan. 9, 1883, was composed as follows: President of the Council, Don Pedro Manuel Sagasta, appointed Feb. 8, 1881; Minister of Foreign Affairs, Don Antonio Aguilar, Marquis de la Vega de Armijo; Minister of Grace and Justice, Don V. Rimitero Giron; Minister of Finance, Don J. Pelayo Cuesta; Minister of the Interior, Don Pio Gullon; Minister of War, Gen. A. Martinez Campos; Minister of Marine, Vice-Admiral R. R. Arias; Minister of Commerce and Agriculture, Don G. Gamazo; Minister of the Colonies, Don Gaspar Nuñez de Arce. This Cabinet was replaced in October by the following: President of the Council, Señor Posada Herrera; Minister of Foreign Affairs,

Señor Ruiz Gomez; Minister of Grace and Justice, Señor Navarro Rodrigo; Minister of Finance, Señor Gallostra; Minister of the Interior, Señor Moret; Minister of War, Gen. Lopez Dominguez; Minister of Marine, —; Minister of Commerce and Agriculture, Marquis Sardeal; Minister of the Colonies, Señor Suarez Inclan. The present Council of Ministers, formed on Jan. 18, 1884, is made up thus: President of the Council, Señor Cánovas del Castillo; Minister of Foreign Affairs, Señor J. de Elduayen; Minister of Grace and Justice, Señor Silvela; Minister of Finance, Señor Cോഗayon; Minister of the Interior, Señor Romero y Robledo; Minister of War, Gen. Quesada y Matheus, Marquis de Miravalles; Minister of Marine, Admiral Topete y Carballo; Minister of Commerce and Agriculture, Señor Pidal y Mon; Minister of the Colonies, Count Tajada de Valdosera. The President of the Senate was the Marquis de la Habana; and the Vice-Presidents, Señor T. Montejo y Robledo, the Count de Torre Mata, the Duke de Tetuan, and Señor J. Moreno Benitez. The President of the Chamber of Deputies was Señor José Posada Herrera; and the Vice-Presidents, the Marquis de Sardeal, Señor T. Ruiz Capedon, the Marquis de Valdeterrazo, and Señor A. Linares Rivas.

The Spanish Envoy Extraordinary and Minister Plenipotentiary to the United States is Don Juan Valera (accredited in 1884). The United States Envoy Extraordinary and Minister Plenipotentiary to Spain is Hon. John W. Foster. The Spanish Consul-General at New York is Don M. S. Guanes.

Area and Population.—Spain, with an area (including the Balearic and the Canary islands) of 195,774 square miles, is divided into forty-nine provinces, and had, in June, 1883, according to official statistics, a population of 16,858,721, against 16,625,860 (inclusive of 12,170 inhabitants of the Spanish possessions in Northern Africa, not figuring in the returns for June, 1883), as given in the census reports for Dec. 31, 1877. The excess of females is commonly about 250,000. The mean density of the population is 85 per square mile: the maximum, 280, being in the province of Barcelona; and the minimum, 32, in the province of Ciudad Real. The number of births registered in 1882 was 493,817 (6 $\frac{1}{2}$ per cent. illegitimate); that of deaths, 435,477: surplus, 58,340. The increase of population during the past hundred years has not exceeded 75 per cent. From 11,000,000 in 1820, the number of inhabitants had reached to about 13,698,000 in 1828; the census of 1846 showed it to be 12,168,774; and that of 1860, 15,658,531. By comparing these last figures with those of the census of Dec. 31, 1877, the annual rate of progress for the seventeen years is seen to have been '35 per cent. approximately. The cities credited with upward of 50,000 inhabitants in the census returns of 1877 were: Madrid, 897,816; * Barcelona, 248,943; Va-

* The municipal government of the capital reported the

lencia, 148,861; Seville, 194,818; Malaga, 115,882; Murcia, 91,805; Saragossa, 84,575; Granada, 76,005; Carthagena, 75,908; Cadiz, 65,028; Jerez de la Frontera, 64,533; Palma, 58,224; Lorca, 52,934; Valladolid, 52,206.

The colonies, with their areas and populations (returns for 1877, 1880), are as follow:

COLONIES.	Area in square miles.	Population.
AMERICA.		
Cuba.....	43,220	1,521,684
Porto Rico.....	3,560	731,648
Total in America.....	46,770	2,253,332
ASIA.		
Philippine Islands.....	65,100	5,559,020
Caroline Islands and Palaoos.....	905	36,000
Marian Islands.....	420	8,665
Total in Asia.....	66,425	5,603,685
AFRICA (GUINEA).		
Fernando Po, Anabon, Corisco, Elobey, and territory of San Juan.....	488	81,106
Grand total.....	113,678	7,888,128

Religion.—The established religion of the kingdom is the Roman Catholic, whose clergy are, by the terms of the Constitution, to be maintained by the state. Protestant services must be absolutely private; the number of Protestant churches was reported at 58 in July, 1876. Of the 16,625,860 inhabitants in 1877, about 16,605,000 were Catholics; 6,220 Protestants; 9,640 Rationalists; 400 Jews; 300 Mohammedans; 200 Buddhists.

Education.—According to the census of 1846 but 1,221,001 persons of both sexes could read and write, and the total number able to read and not write was only 1,898,288. The census of 1860 showed that 3,129,921 (of whom 715,906 were females) could read, but not write; and that some 12,000,000 could neither read nor write. The number of primary schools throughout the kingdom in 1878 was given at 29,600, with an attendance of 1,611,000. Secondary or intermediate instruction is given in 58 public schools, with an aggregate of 757 teachers and 13,881 pupils. The average annual expenditure, by the Government, for public instruction, does not exceed \$1,250,000.

Finances.—The following tables exhibit the revenue and expenditure, as estimated in the budget for the year ending June 30, 1884:

REVENUE.	Pesetas.*
Direct taxes.....	289,395,000
Indirect taxes.....	192,329,000
Customs receipts.....	128,909,000
Registration, stamped paper, state monopolies, etc.....	251,390,000
Yield of national property.....	18,944,886
Treasury receipts.....	91,210,000
Total.....	802,876,886

population at 475,568 on Dec. 31, 1882. The number 500,900 stated for June, 1883, by the "Almanach de Gotha," is exaggerated.

* The peseta equals twenty cents.

EXPENDITURE.	Pesetas.
Civil list.....	9,900,000
Cortes.....	1,968,785
National debt.....	278,888,448
Indemnities.....	2,467,748
Pensions, etc.....	47,968,416
Presidency of the Council of Ministers.....	1,101,709
Ministry of Foreign Affairs.....	8,876,870
" Justice.....	54,180,917
" War.....	128,621,705
" Marine.....	88,598,929
" the Interior.....	46,106,065
" Commerce and Agriculture.....	44,989,717
" Finance.....	20,871,921
Expenses of collecting direct tax, and of stamp, etc., department.....	187,894,050
Total.....	801,640,898

Besides the foregoing estimates of the revenue and expenditure in ordinary, there was for the same year a budget extraordinary, comprising:

	Pesetas.
Revenue extraordinary.....	80,981,050
Expenditure extraordinary.....	80,827,896

Thus the aggregate estimates for the year stand thus:

REVENUE.	Pesetas.	Pesetas.
Ordinary.....	802,876,886	
Extraordinary.....	80,981,050	889,857,936

EXPENDITURE.	Pesetas.	Pesetas.
Ordinary.....	801,640,898	
Extraordinary.....	80,827,896	881,967,794

Estimated surplus..... 7,840,142

The revenue extraordinary was calculated to be made up partly of the proceeds of sales of national property and partly of the proceeds of conversions of the debt.

Here follow the budget estimates for the years ending June 30, 1880, 1881, and 1882, respectively:

YEARS.	Revenue.	Expenditure.
1879-'80.....	Pesetas. 778,475,888	Pesetas. 804,500,940
1880-'81.....	791,650,792	884,651,198
1881-'82.....	788,000,000	752,650,000

A balanced budget, the first for many years in Spain, was presented by Señor Camacho in 1881. But his flattering estimates were not realized, and a large deficit, as usual, resulted. Convinced that improvement was hopeless under the financial system followed by his predecessors, that minister introduced a series of reforms which in a short time placed the Spanish finances in a more satisfactory condition than ever before, and which, it was freely admitted even by the most decided opponents of the present Government, would permanently raise the standard of the national credit. A chief point of his policy was, to avoid past causes of deficiencies, and to attain this he proposed several measures of administrative economy, to be supplemented by new indirect taxes. But his most important scheme was that for the conversion of the whole national debt into a series of 4 per cents., with the exception of the 5 per cent. consolidated due to the United States, the 8 per cent. to Denmark,

and the 8 per cent. securities and guarantees. The entire capital of the debt was reduced from 12,800,000,000 pesetas, as estimated for Jan. 1, 1881, to 6,000,000,000. In accomplishing this reform, sanctioned by the law of Dec. 9, 1881, Señor Camacho, far from overlooking the rights of the foreign holders of the 2 per cent. stock, allowed them an additional 2 per cent. beyond the price of 50 fixed for the interior, thus compensating them for loss by exchange, and bringing up the value slightly in excess of the difference which existed in their favor at the time of emission. The capital of the debt as converted stood as follows:

	Pesetas.
Foreign debt, at 4 per cent.	3,000,000,000
Redeemable home debt, at 4 per cent.	1,750,000,000
Perpetual home debt, including the railway obligations, at 4 per cent.	2,250,000,000
Total converted debt, at 4 per cent.	6,000,000,000

Under the reform, the annual service of the debt would amount to 237,500,000 pesetas. Not included in the foregoing statement is the estimated amount of obligations incurred on behalf of Cuba, 250,000,000 pesetas.

Army.—The peninsular army of Spain is recruited by conscription or by enlistment, every male Spaniard having completed twenty years of age being liable to serve for a period of twelve years: three in the permanent army, three in the first, and six in the second reserve. Immunity from service may, however, be purchased for 1,500 pesetas. The period of service in the colonial army is eight years: four with the colors, and four in the reserve. The classification by arms is as follows:

INFANTRY.

60 line regiments of 2 battalions each.
 20 battalions of light-infantry (*casadores*).
 140 reserve battalions.
 140 depot battalions.

CAVALRY.

12 regiments of lancers.
 10 regiments of *casadores*.
 2 regiments of hussars.
 24 regiments of reserve.
 24 depot squadrons.

ARTILLERY.

6 regiments and 1 battalion of foot.
 8 regiments of horse.
 2 regiments of mountain.
 6 regiments of reserve.

PIONEERS.

5 regiments of 2 battalions each.

GUARDIA CIVIL (POLICE FORCE).

15 regiments, comprising 730 officers and 14,736 men.

COAST AND FRONTIER GUARDS.

92 companies of foot and 22 sections of horse.

By a decree, under date of July 18, 1883, the strength of the permanent army was fixed as follows for the year 1883-'84: For home service, 114,894, including 20,000 officers; for Cuba, 25,653; for Porto Rico, 3,302; for the Philippine islands, 7,870. The infantry corps in Cuba in April, 1883, was as follows: eight line regiments with two battalions of six companies each, eight battalions of light-infantry (*casadores*) with a like number of companies,

one battalion of public order, two sections of writers and orderlies, one disciplinary brigade, two regiments of militia, two independent battalions, the squadrons of Santa Catalina de Guaso, and two battalions of guerrillas. These troops were officered by 22 colonels, 41 lieutenant-colonels, 124 commandants, 33 captains, 490 first-lieutenants, and 481 second-lieutenants.

Toward the end of 1883, Gen. Lopez Dominguez, Minister of War of the Posada-Herrera Cabinet, introduced a bill into Congress raising the pay of all officers and non-commissioned officers, from sergeants to colonels, both inclusive. The opposition press estimated the increase to the budget from this cause at 12,000,000; and the newspapers favorable to the Government, at 8,000,000. The Minister of Finance, however, in reply to a question put to him in Congress, said that there would be no additional charge to the budget. The skepticism as to this last statement was great. A journalist suggested, as a possible explanation of Gen. Lopez Dominguez's plan, the proposed reduction of the strength of the permanent or active army by 20,000, in time of peace; the war budget being maintained at the same level as before the reduction, the saving might be applied to give officers sufficient pay to allow them to live. One thing was, however, stated as certain, namely, that no increase in the expenses of the War Department could be sanctioned by Congress, unless extraordinary resources were provided to meet the outlay. Spain, like Italy, spends 16 per cent. of her revenue on the army.

Navy.—The navy was, according to official reports, composed of the following craft in 1883:

	FIRST CLASS.	Quas.
5 iron-clad frigates.		60
12 screw-frigates.		220
2 paddle-steamers.		15
SECOND CLASS.		
5 paddle steamers.		12
10 screw-steamers.		24
2 screw-transports.		4
THIRD CLASS.		
1 iron-clad monitor.		8
1 floating battery.		5
24 screw-steamers.		37
48 screw-gunboats.		57
1 paddle-gunboat.		1
6 paddle steamers.		12
1 screw-transport.		2
4 sailing-vessels.
124 Total.		468

The aggregate horse-power of the foregoing craft was 27,986.

The navy was manned by 14,000 sailors, 7,083 marine infantry, and a considerable corps of marine artillery, and commanded by 1 admiral, 80 vice- and rear-admirals, and 644 subaltern officers of various grades.

Commerce.—The exports and imports of the kingdom, for the quinquennium 1878-'82, were respectively of the values expressed in the sub-joined table:

YEARS.	Imports.		Exports.	
	Pesetas.		Pesetas.	
1878.....	541,182,774		479,873,207	
1879.....	604,947,481		528,198,543	
1880.....	712,546,313		612,988,179	
1881.....	495,364,288*		608,090,160*	
1882.....	614,790,798*		642,309,208*	

In the official returns the values of the item "sundries" are commonly omitted from the tables of imports. Judging from the amount of import duties represented by that item in the customs returns for 1872, namely, 14,720,000 pesetas, the invoice value of the item they recorded must have been approximately 96,800,000, which sum, added to the 614,790,798 given in the foregoing table, would bring the total value of the imports for the year in question to 711,590,198.

The chief imports in 1882 were:

	Pesetas.
Cereals.....	24,500,000
Cotton and cotton fabrics.....	91,750,000
Other fabrics.....	61,750,000
Fermented liquors.....	44,250,000
Timber.....	35,500,000
Machinery.....	88,000,000
Sugar.....	27,000,000
Iron and ironwares.....	27,000,000
Coal.....	27,800,000
Animals and animal food.....	25,000,000
Drugs, dyes, and chemicals.....	28,000,000
Hides, skins, etc.....	16,200,000

The principal exports were:

	Pesetas.
Wine.....	297,000,000
Metals and minerals.....	190,000,000
Fruits.....	58,750,000
Olive-oil.....	12,750,000
Cork-wood and corks.....	18,200,000

The subjoined table exhibits the quantities of the various mineral products exported in the years 1881 and 1882:

	1881.		1882.	
	Tons.		Tons.	
Quicksilver.....	1,779		1,067	
Copper.....	17,710		22,708	
Iron.....	87,908		40,116	
Metallic lead.....	105,809		118,182	
Zinc-ore.....	80,604		25,583	
Rio Tinto copper-ore.....	452,475		571,442	
Iron-ore.....	8,187,088		4,021,761	
Other ores.....	70,227		70,094	
Totals.....	8,853,690		4,869,153	

The values of the exports to and imports from Germany, Great Britain, France, Belgium, and the United States, for each of the years 1878 and 1882, were as follow:

COUNTRIES.	EXPORTS.		IMPORTS.	
	1878.	1882.	1878.	1882.
	Pesetas.	Pesetas.	Pesetas.	Pesetas.
Germany.....	6,750,000	6,100,000	12,500,000	82,500,000
Great Britain..	155,000,000	287,250,000	141,250,000	170,750,000
France.....	120,000,000	310,000,000	178,250,000	
Belgium.....	7,125,000	7,000,000	24,750,000	82,500,000
United States..	14,750,000	25,000,000	65,000,000	91,500,000

The foregoing figures, resulting from an analysis of the Spanish Gray-Book, show the exports to Great Britain to have increased 50

* Official.

per cent., despite the falling off in wine and the low price of lead in 1882. The imports from England have practically remained stationary in the period here considered, although less than in 1872, 1873, 1874, and 1875, and showing no increase over 1877. The exports to France have increased 160 per cent.; and the imports 18 per cent. In the exports to Germany a slight decline is observed, while the increase in the imports therefrom is no less than 540 per cent.

The total value of the imports from Belgium has remained practically without change; but the imports show an increase of 81 per cent. A considerable development is noticeable in the general commerce with the United States, both the imports from and the exports to that country having increased about 50 per cent. There is a growing trade between Spain and the Scandinavian countries, with which the final negotiations for a commercial treaty were made early in 1883: the imports from Sweden and Norway are reported at the annual value of 18,000,000 pesetas, and the exports thereto at 3,000,000. Codfish is yearly imported from Norway into Spain to the amount of some 12,500,000 pesetas, or about 72 per cent. of the total annual Norwegian catch.

The total value of the exports from Spain for the month of January, 1883, amounted to 57,567,446, against 56,182,978 for the corresponding month in 1882.

The prohibitory import duty on refined petroleum in Spain secures a monopoly of that article to native refiners. At Ferrol, in the province of Corunna, a refinery yielding 1,000,000 gallons annually, has been in operation since 1880; and another of longer standing has proved very successful in the city of Corunna.

A proposed Anglo-Spanish commercial treaty has met with vigorous opposition in the industrial centres of Catalonia, while its conclusion has been anxiously desired elsewhere throughout the kingdom. (For details concerning a treaty of commerce with the United States, see page 649 of this volume.)

Navigation.—The shipping movements at the several ports of the kingdom were as follow for 1879, since which year no official returns of this class have been published:

FLAGS.	ENTERED.		CLEARED.	
	Vessels.	Tons.	Vessels.	Tons.
Spanish.....	4,759	918,902	5,981	2,904,536
Foreign.....	7,166	2,693,561	8,296	2,985,225
Totals.....	11,925	3,614,463	14,277	4,191,761

The merchant navy of Spain, in April, 1883, comprised 1,674 sailing-craft representing a total of 186,164 tons; and 389 steamers, representing an aggregate tonnage of 304,192, and an aggregate of 93,923 horse-power.

Railways.—The total length of the railways of Spain on Jan. 1, 1883, was 4,942 miles; 1,075 have been built in the reign of King Alfonso.

All the lines are the property of private companies, but subsidized by the state. The total amount of Government subventions to railways down to Dec. 31, 1880, was 650,000,000 pesetas. The aggregate receipts of the railways of Spain reached 139,218,525 pesetas, for 1880, against 61,818,275 pesetas working expenses.

Telegraphs.—The state telegraph lines in 1881 were of a total length of 10,417 miles. Of the aggregate of 3,978,804 dispatches, one fourth were international, and one fifth of the remainder, official.

Post-Office.—The number of letters and postal-cards that passed through the post-office in 1881 was 94,962,000; that of newspapers, 40,000,000; and that of packets of samples, 6,000,000.

Philippine Islands.—The chief export staples of this archipelago are sugar, hemp, tobacco, cigars, coffee, and dye-woods; the first representing alone about 60 per cent. of the total value of the export trade, which in 1881 amounted to \$20,777,000, against \$25,493,319 in 1880. The sugar shipped in 1881 was of the value of \$12,403,993; and the hemp, raw and manufactured, \$9,026,404.

The exports to Great Britain in 1882 were reported at the value of \$11,535,585, of which \$7,128,440 stood for unrefined sugar, and \$4,150,165 for hemp. The imports from Great Britain in the same year were of the value of \$8,963,975, about two thirds of which were for cotton fabrics.

Historical Sketch.—By the beginning of 1883 Socialism had extended its contagion to the Peninsula, and made its presence so sensibly felt as to divert public attention from the wearisome debates of the legislative halls. Anarchy had developed in the industrial centers and throughout Andalusia, but particularly in the provinces of Cadiz and Seville, where the tenebrous society of the *Mano negra* (Black Hand) was organized with tendencies little less alarming than those of the Nihilists of other parts of Europe. As many as one thousand members of the organization were detected and imprisoned in February; and documents found in their possession showed the adherents of the *Mano negra* to number eight or nine thousand scattered throughout the kingdom. Ramifications were discovered in Portugal also, and a band of seven Nihilists was seized in Oporto in March, one of these being the editor of a socialistic journal, "O Operario." Despite this singularly vitiated state of society, party wars and parliamentary dissensions continued with unabated intensity; and the Sagasta ministry had to struggle hard to maintain its entity between its allies of the left and its more moderate allies, and escape entanglement in the conflicts incessantly rising around it. Spain was not, indeed, free from political crises which might well become serious one day or other; but in May these and other concerns of a purely national character were for a moment forgotten, and Castilian courtesy was displayed in a succession of splendid *fêtes* in honor of

their Majesties of Portugal, whose visit to their cousins of Spain, rather than a mere return for that of King Alfonso and Queen Christina to Lisbon the year previous, was intended as a seal of friendship between the two families and a renewal of cordial intimacy between the two countries. Not that the Utopian idea of an Iberic union had been revived; indeed, in exchanging toasts Dom Luiz and Don Alfonso hinted clearly that no alliance, however close, between the two nations should interfere with the "independence or autonomy of either." Such, indeed, is the only possible basis of an enduring union between Spain and Portugal, serving the latter as a shield against any oppressive influences that might threaten her, and bringing to the former an additional sense of security in the friendship of her neighbor.

Before the apprehensions aroused by the Socialistic movement already alluded to had been completely lulled, the country was thrown suddenly into consternation by the announcement that on the night of August 4th, some officers of the reserve, at the head of a handful of troops, had seized the citadel of Badajoz, and that a revolutionary *junta* had proclaimed the republic. No military insurrection had taken place since the accession of the present sovereign, and the incident, although alarming, might have been regarded as purely local and temporary, had it not been immediately followed by an outburst in a regiment encamped near Logroño, on the banks of the Ebro, and tidings of disturbance in Barcelona. By prompt action on the part of the Minister of War, the manifestations of sedition were effectually repressed both in the north and the southwest; but in most minds a feeling of doubt remained as to whether they were not the symptoms prematurely developed of a general anti-monarchical agitation. Meantime the danger seemed to have entirely passed away; and Don Alfonso, in a tour through some of the provinces, received from the people as well as from the army unequivocal proofs of unshaken popularity. An immediate result of the trouble, however, was a painful conflict of opinion between the President of the Council and the liberal members of the Cabinet, on the one hand, and the Minister of War and his friends on the other, as to the expediency of a vigorous policy of precaution or one of conciliation. Señor Sagasta's views prevailed; the state of siege was discontinued in the centers of the recent tumults, and the constitutional guarantees, for a time suspended, were restored. The breach already existing between the liberal portion of the Cabinet, represented by the Premier, and the more conservative faction, represented by Gen. Martínez Campos, was now widened beyond remedy, and the inevitable crisis was only deferred until after the King's return from Germany. Recreation was the ostensible object of Don Alfonso's visit to the northern courts, at a time when the kingdom was in such an unsettled condition; but the inter-

ruption of friendly relations with France had like to be a conspicuous result of the tour. As the sovereign of a generous nation, allied besides to the imperial family of Austria and to most of the royal houses, he was cordially received beyond the Rhine, and honored by the Emperor of Germany with the title of colonel of a German regiment of cavalry. That distinction, granted also to the Prince of Wales and to most European princes, and hence devoid of political significance, was, nevertheless, in this instance, the cause of a distressing incident. On returning homeward, through France, the King was met at Paris by the jeers and hootings of an infuriated mob whom "demagogues of the press" had taught to regard the German title as an insult to the French nation. "The incident," says a French journalist, "is profoundly humiliating, not for the King of Spain, but for our Government, who did not protect their guest from insult. We can only except from this charge the President of the Council and the Minister of Foreign Affairs, who alone appear to have done their duty." Satisfaction was demanded and obtained by the Spanish Government. But, not content with this, the Marquis de la Vega y Armijo persistently demanded of France still further reparation, regarded as unnecessary by his colleague; and here was a new element of dissension in the Cabinet, which, though not the primary, proved to be the precipitating cause of the downfall of the Sagasta ministry. The primary cause dated from the reappearance of sedition in the army. The King now resolved upon a somewhat hazardous experiment, and charged Señor Posada-Herrera with the task of reconstituting the Cabinet, and on October 18th the new ministry was composed partly of the personal friends of Señor Posada, and partly of those of Marshal Serrano (the leader of the party now called the Dynastic Left), including among the latter Gen. Lopez Dominguez, one of the most distinguished officers of the army, and Señor Moret, one of the most brilliant orators of the Spanish Parliament. The members of the Dynastic Left came to power under the banner of Posada Herrera (one of the oldest statesmen of Spain, formerly a Moderate, later a minister in the Liberal Union with Gen. O'Donnell, and a conservative by instinct, education, and tradition), with a programme embracing, among others, such bold and ambitious reforms as the revision of the Constitution, universal suffrage, the re-establishment of civil marriage, and the reorganization of the army. It soon became apparent, however, that the ministry could neither live nor carry out its plans without the aid of the late Sagasta Cabinet, and that the majority so sincerely devoted to that statesman's policy and which had so long sustained him was far from being favorable to the revision of the Constitution of 1876 or the re-establishment of civil marriage. And as for the doctrines of free-trade, advocated by a few members of the

Posada Cabinet, they are anything but popular in Spain, particularly in the more agitated regions of the north, such as Catalonia. While the Free-traders were planning a banquet in honor of the proposers of the preliminary arrangements for treaties of commerce with England, Italy, and Portugal, the Catalans were quietly working with other protectionists to dispose the Cortes unfavorably toward those preliminary arrangements. It was asserted that the Fusionist party would not accept universal suffrage, "an outcome of revolutions, which would bring soldiers to the polls, and enable the *caciques* to work their will by means of the ignorant masses." They were willing to accept the suffrage granted in 1882 for the election of provincial deputies, which included all males of Spanish birth over twenty-five years of age who could read and write and paid an almost nominal amount of taxes. Practically this suffrage would only treble the number of electors. Thus the change of ministry was productive of no improvement in the general situation; on the contrary, the nervous apprehensions revived by the Badajoz and Logroño incidents, after a slumber of eight years, had rather increased than diminished at the end of the year under the additional disquieting causes due to the prolonged political crisis in Government spheres. The newspapers announced that precautions had been taken in various parts to preserve order, and private letters from bankers and merchants to the capital confirmed the alarm felt among the respectable, peaceful classes at a course of events indicative of the return of elements of disorder believed to have disappeared for a long time, if not forever. A dissolution appeared inevitable. But with whom would the King make it? Sagasta was neither a Liberal nor a Conservative. Posada Herrera headed a Cabinet of the Left without belonging to the Left; he was expected to be conciliatory, but he was powerless either for conciliation or domination. The restoration of the Conservatives under Cánovas del Castillo seemed to be a more promising alternative, and the events of Jan. 18, 1884, confirmed its adoption.

Meanwhile the Carlists and Zorillists were at work, and, as it was said that although the King could reckon on his generals, it was not certain that he could reckon on the soldiers, the question was whether the latter "would raise the butt-ends of their muskets or the bayonets."

The marriage of the Infanta María de la Paz Juana de Borbon y Borbon, the King's sister, to the Prince Royal, Ferdinand Louis, of Bavaria, was celebrated on April 8, 1883, in Madrid.

The visit of Frederick William, of Prussia, to Madrid, in December, was unattended by any "change in the foreign policy of Spain."

STEPHENS, Alexander Hamilton, an American statesman, born in Taliaferro county, Georgia, Feb. 11, 1812; died in Atlanta, Ga., March

4, 1868. He lost his father when he was a mere boy; after which he lived with his uncle, till friends sent him to a classical academy; thence he went to the State University at Athens, known as Franklin College, where he was graduated in 1832. He was admitted to the bar in 1834. In 1836 he was elected to the State Assembly, though known to be opposed to nullification doctrines and vigilance committees. His health broke down the next year, and was never afterward vigorous. He was re-elected to the Legislature in 1837 and the three following years, but declined re-election in 1841; yet in the year following he was sent to the State Senate. Here he was active and industrious on the subject of internal improve-

against the Whigs. In February, 1847, he submitted a series of resolutions in relation to the Mexican War, which war he charged upon President Polk as a violation of the Constitution, undertaken for conquest. The House, however, refused a vote on the resolutions. He opposed the Clayton Compromise in 1848, despite opposition and denunciation at home and elsewhere. At this time he was murderously attacked by a man from his own State, and was nearly cut to pieces. In 1850 he opposed the growing secession sentiment in the South, which made headway because of the admission of California into the Union, and after an active canvass in Georgia he carried the day against the secessionists. The Georgia platform of 1850 was the work of the committee of which Mr. Stephens was a member. He opposed Gen. Taylor's policy, and supported the Kansas-Nebraska Act of 1854. The next year he took ground against the "Know-Nothing" movement, and was returned to Congress on this issue alone. Some of his noted speeches of this date may be named here—as, the eulogy on Andrew Pickens Butler; debate with Zollicoffer, of Tennessee, on slavery in the Territories; on the neutrality laws; on impeachment of Judge Watrous; and his last, on the admission of Oregon into the Union.

ALEXANDER HAMILTON STEPHENS.

ments. He also drew up the minority report on the state of the republic, and gained greatly in reputation as an orator in the debates.

Mr. Stephens was nominated for Congress in 1843, on the general ticket (there being no districts in Georgia as yet). He engaged ardently in the canvass, and gained his election by a large majority. He thereupon began service in the House of Representatives which lasted for sixteen years, and was then interrupted by his course as to secession for nearly as long a time. In 1844 he supported Henry Clay for President, but he urged the admission of Texas into the Union, thus taking ground

At the close of the Thirty-fifth Congress, Mr. Stephens declined being a candidate for re-election, and in a speech which he made at Augusta, July 2, 1859, he announced his retirement from public life. During the presidential canvass of 1860, however, he sustained Mr. Douglas. In November of that year he spoke out boldly against secession, and begged the South not to be the aggressor. "If the republic is to go down," said he, "let us be found to the last moment standing on the deck, with the Constitution of the United States waving over our heads. Let the fanatics of the North break the Constitution, if such is their fell purpose. Let the responsibility be upon them." But he reserved the right to "strike" if Lincoln should violate the Constitution, and professed himself to be perfectly subservient to his State and her will in all matters. He further proposed a convention to consider the question of secession, which convention met two months later (Jan. 16, 1861), at Milledgeville, and passed an ordinance of secession, though Mr. Stephens voted against it. His idea was with others (as he sets forth in his book on the "War between the States") that by seceding, or threatening to secede, the South could force better terms in the struggle against the free States and

for the continuance of slavery. He was a member of the Congress which met in Montgomery, Ala., Feb. 4, 1861, and was made Vice-President of the Confederacy. On March 21st he made a speech in Savannah, in which he announced himself as ready to do all that was to be done to break up the Union and secure a separation from the North and West. A month later he went to Virginia, and urged upon the convention in Richmond that the venerable mother of States should cast in her lot with the Confederacy. When in the progress of the war it became evident that the Confederacy was doomed, Mr. Stephens made various efforts to open negotiations looking toward peace with the national Government. He avows, in his book, that he desired to give up all opposition and return to peaceful submission, provided the United States would guarantee absolute State sovereignty. He was at the Hampton Roads conference, where President Lincoln and Secretary Seward met him and two others, R. M. T. Hunter and J. A. Campbell, on a gunboat, Feb. 3, 1865, and for four hours discussed the whole situation and the terms on which peace would be possible.

After Lee's surrender he returned to his home in Crawfordville, where he was arrested, May 11th, and sent to Fort Warren, in Boston harbor. After five months' imprisonment he was dismissed on parole, Oct. 11, 1865. In February of the next year he made a speech before the Legislature of Georgia, in which he favored the restoration policy of President Johnson. The same month he was elected to the United States Senate, but, as Georgia was not yet readmitted, he was not permitted to take his seat. He was elected to Congress in 1872, and again in 1874, 1876, and 1878.

In a speech, Feb. 12, 1878, on occasion of Congress receiving a painting of the signing of the Emancipation Proclamation by President Lincoln, Mr. Stephens took occasion to speak in high terms of Lincoln, and to say further that, in advocating secession in 1861, he did not suppose the dissolution of the Union would be permanent.

Mr. Stephens was nominated for Governor of Georgia in 1882, and after an active canvass, in which he participated, was elected, and entered upon his duties, but, after two months of service, he broke down in health. He was a man of large acquirements and varied reading, and was noted for his kindness and official aid to struggling young men.

A volume of speeches and letters by Mr. Stephens was published in 1867. His chief work, "A Constitutional View of the Late War between the States, its Causes, Character, and Results," appeared, in two volumes, in 1868-'70.

SUEZ CANAL, THE, a tidal ship-canal connecting the Mediterranean with the Red Sea by a cutting through the Isthmus of Suez, belonging to the Compagnie Universelle du Canal Maritime de Suez. In the acts of concession it was

declared neutral, and free to all nations. It was opened for navigation Nov. 17, 1869. The canal has a total length of 160 kilometres, a uniform depth of 8 metres, and a width of from 58 to 100 metres at the surface of the water and 22 metres at the bottom. The company is incorporated in France and Egypt. Its president is Ferdinand de Lesseps.

Finances.—The capital outlay, including cost of enlargement, improvements, and loans, amounted at the end of 1878 to 479,175,688 francs. The capital was derived from the sale of shares, authorized to the amount of 200,000,000 francs; from a subvention of 84,000,000 furnished by the Khedive; from first-mortgage 5 per cent. bonds issued, to the amount of 100,000,000, at 60 per cent. and redeemable at par; from 120,000 thirty-year bonds of 125 francs, at 8 per cent. interest, issued in 1871 at the price of 100 francs; from various concessions, the product of which was about 80,000,000; and from sales of lands and other sources. In 1882 there were outstanding 897,488 of 500-franc shares; 801,848 obligations of 500 francs; 88,998 delegations of 500 francs each, bearing interest at 5 per cent.; 99,990 thirty-year bonds; 15,152 8 per cent. 500-franc bonds; and 400,000 bonds of 85 francs, bearing 5 per cent. interest, representing unpaid share coupons, besides 100,000 founders' shares which participate in the surplus profits.

Of the 897,488 shares, 176,602 originally belonged to the Khedive. They were purchased from him by the British Government in November, 1875. The sum paid was £3,976,582. The Khedive in 1869 assigned the dividends on these shares up to 1894 to the company, which issued 120,000 delegations entitling the holders to these dividends. The company's charter provides that, of the net profits, when more than sufficient to pay the 5 per cent. dividend on the shares, 71 per cent. shall go to the shareholders, 15 per cent. to the Egyptian Government, 10 per cent. to the holders of founders' shares, 2 per cent. to form an invalid fund for employes, and 2 per cent. to the managing directors. The founders' share of the surplus profits in 1881 was £98,721. The canal yielded a surplus profit in 1872 for the first time. It amounted to 2,071,279 francs, increased in rapid progression to 16,048,451 francs in 1877, and then fell off to 12,830,145 francs in 1880, but was much greater in the succeeding two years. The surplus dividend in 1881 paid to shareholders was 18·7 per cent. The receipts of the canal were 8,998,782 francs in 1871; 16,407,591 in 1872; 22,897,819 in 1873; 24,859,888 in 1874; 28,866,302 in 1875; 29,974,998 in 1876; 32,774,844 in 1877; 31,292,847 in 1878; 29,876,867 in 1879; 41,790,900 in 1880; 54,676,000 in 1881; and 60,504,878 in 1882. The total expenditure in 1880 was 28,811,808 francs; in 1881, 28,699,000.

Statistics.—The number and tonnage of vessels passing through the canal each year since 1875 were as follow:

YEAR.	Number.	Tonnage.
1875.....	1,494	2,940,708
1876.....	1,457	3,072,107
1877.....	1,668	3,413,949
1878.....	1,598	3,351,535
1879.....	1,477	3,228,943
1880.....	2,026	4,844,519
1881.....	2,737	5,794,401
1882.....	3,198	7,123,126

Somewhat more than three fourths of the shipping that passed through the canal in the ten years 1870-'79 belonged to Great Britain.

History.—M. de Lesseps, immediately after the accession of Said Pasha, laid before him the scheme for the canalization of the isthmus, and received, Nov. 30, 1854, a deed of concession from the Viceroy, conferring upon him authority and exclusive power to construct a canal. A second act of concession, signed Jan. 5, 1856, defined more fully the privileges and obligations of the company. The company was endowed with the absolute grant of a wide strip of land and the right to claim patents for any lands it should reclaim by irrigation-works, besides the use of forced labor and other privileges. The canal was to revert to the Government ninety-nine years after the date of completion. Lord Palmerston combated the project, and sought to have the charter rejected by the Sultan. He was opposed to the opening of a shorter route to the East under French auspices, and feared the establishment of a French colony on the isthmus. British shipping interests favored the longer and more profitable route. The English opposition stimulated the subscription of French capital. The Porte declared its opposition to the scheme, and, in consequence, a new arrangement was made between the company and the Egyptian Government, Jan. 30, 1866. All the lands of the company but about ninety yards on each side of the canal were retroceded, as well as the sweet-water canal from Cairo. The question of compensation for the revoked concessions was submitted to the arbitration of the Emperor Napoleon, in accordance with whose awards the Khedive paid the company 30,000,000 francs for the canceled land-grant, 10,000,000 for the sweet-water canal, 10,000,000 for land and buildings near Cairo, and 74,000,000 to compensate for the concession of forced labor. This settlement was the cause of the hypothecation of the Khedive's shares. The Government spent 31,000,000 in completing the sweet-water canal, and 25,000,000 in various missions to Europe and on the opening festivities. The charter, thus modified, was ratified by the Sultan, March 19, 1866. The canal was completed at a cost of about 200,000,000 francs for the work of construction, though the total disbursements, including improvements, were more than double that.

Military Operations in 1882.—Having secured the safety of the canal by means of assurances to Arabi Pasha that its neutrality would be respected, M. de Lesseps protested against its

occupation by English troops in September, 1882. The British Government asserted that the declaration of neutrality did not apply, since it was at war with the *de facto* master of Egypt, and also because it had the authorization of the Khedive to suppress the rebellion. The concession documents recognize the power of the Khedive to exercise police control over the canal, and also the right to occupy every strategic point necessary for the defense of the country. The military operations brought in for the company about 2,000,000 francs. The British Government did not acknowledge the obligation to pay transit-dues for its military transports, but paid them voluntarily, in recognition of the service rendered by the canal in the suppression of the rebellion.

English Shipowners.—The English steamship companies, during the earlier diplomatic controversies over the canal, had forced the company to come to their terms regarding the measurement of tonnage, etc. The English protectorate over Egypt was assumed chiefly to preserve the neutrality and freedom of the canal. The ship-owners thought to force the company to concede advantages which they could not have obtained through diplomacy or by direct treaty with the managers, if they could not oust the French management altogether. The Beaconsfield Government had provided for the bringing of the canal ultimately under English direction by purchasing the Khedive's shares, constituting 44 per cent. of the capital stock. This menace to the prospects of the canal as a richly-paying investment, and the diversion of M. de Lesseps's attention to other enterprises, caused many shares to be turned out into the speculative market, so that an amount sufficient to make a majority, with the shares owned by the Government, could easily be acquired, if it was not already in the hands of English holders. Yet during the twenty-five years for which the Khedive had alienated the dividends of his shares, the voting proxies for those shares belonged to the holders of the delegation certificates, and for that period, therefore, M. de Lesseps and his friends were firmly seated in the control of the company.

The existence of political levers by which the English customers could bring pressure to bear on the company, led to constant friction and complaints of the company's management, of the officialism, the rigid regulations, etc. The chief object and main burden of the complaints, however, was to compel the company to reduce its tolls, fixed by statute at 10 francs a ton, and yield other pecuniary advantages. The ship-owners demanded that the company should divide with them its profits, which, under the statutes, would soon reach the normal rate of from 20 to 30 per cent., and that the transit dues be lowered to 6 francs a ton.

The Project of an Alternate Canal.—When the president and directors, in the interest of the stockholders, refused to accede to the pecuniary

sacrifices demanded, the scheme was broached of a second competing canal across the isthmus, constructed with English capital, and managed in the interest of English navigation. M. de Lesseps averred, in reply, his exclusive right. Projects of a ship-canal through Egypt by way of Cairo, and of one through the Jordan valley, failed to arouse practical interest. The Lesseps canal route, through the Bitter Lakes, follows a natural depression, and is the only practicable one across the isthmus, so that a second canal would have to be dug close beside the existing one.

Provisional Agreement of the English Government.—The English Government, having strong motives to avoid giving fresh cause for irritation to France, was the less likely to be influenced by the chicanes of the steamship-owners, animated by private commercial considerations. An agreement was reached between it and M. de Lesseps, whereby it secured valuable concessions to the ship-owners, and arranged for the enlargement or duplication of the canal, but recognized the monopoly of the Universal Company in the Suez route, and offered to advance the £8,000,000 required, at 3½ per cent. interest. A storm of reproaches assailed the Government for refraining from annulling the franchises of the company in the interest of English navigation, which furnished four fifths of the Suez traffic. As enormous pecuniary interests were involved, the subject was fiercely agitated; and the Government, in the face of this opposition, reluctantly withdrew the proposals, and suggested that M. de Lesseps and the ship-owners come to an agreement among themselves.

The Ship-owners' Agreement.—Such an agreement was finally arrived at in the beginning of December. The company promised to enlarge the canal or construct a second one, in accordance with the report of a commission of experts, one half of whom should be English engineers. In addition to the three directors nominated by the English Government, seven new English directors should be admitted; making ten Englishmen on the board to twenty-two Frenchmen. These English directors are to constitute an advisory board. The company will open an office and receive dues in London, and largely increase the number of English-speaking officials. The last sur-tax of 50 centimes disappears on Jan. 1, 1884, and pilotage dues July 1st. All expenses from groundings and other accidents, except collisions, or such as are due to negligence, are to be borne by the company. The company reduces the transit dues to 9½ francs after Jan. 1, 1885, and will divide half the profits in excess of 18 per cent. with the ship-owners, in addition to the abatement of 50 centimes. Each successive rise in the profits is to be divided in the same way, by reducing the transit dues for the next year but one, that is, from the 1st of January following the report, by the quotient of the total tonnage into the moiety of the increment

of profit. Above 25 per cent., the whole excess will be divided, until the transit dues are reduced to 5 francs a ton. A reduction in the tolls for ships in ballast to 7½ francs had been already made, Oct. 1, 1883.

SUGAR. The importation of crude sugar during the earlier part of the year 1883 was lower than that of the corresponding months in 1882, on account of the proposed change in the duties. On June 1st the revised tariff came into force. The new rate is as follows:

All sugars not above No. 18 Dutch standard in color shall pay duty on their polariscopic test, as follows, viz.: All sugars not above No. 18 Dutch standard in color, all tank-bottoms, sirup of cane-juice or of beet-juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above 75 degrees, shall pay a duty of one and forty-hundredths cent per pound; and for every additional degree or fraction of a degree shown by the polariscopic test, they shall pay four-hundredths of a cent per pound additional. All sugars above No. 18 Dutch standard in color shall be classified by the Dutch standard of color, and pay duty as follows, namely: All sugar above No. 18 and not above No. 16 Dutch standard, two and seventy-five hundredths cents per pound. All sugar above No. 16 and not above No. 20 Dutch standard, three cents per pound. All sugars above No. 20 Dutch standard, three and fifty-hundredths cents per pound.

Molasses, testing not above 56 degrees by the polariscope, shall pay a duty of four cents per gallon; molasses testing above 56 degrees shall pay a duty of eight cents per gallon.

This act led to examinations by the polariscope, and laboratories were equipped at the sugar-importing ports. The method is quite simple: 18·024 grammes of the raw substance is brought into solution in a graduated 50-cubic centimetre flask. When it is dissolved, a few drops of lead acetate are added. Then the solution is increased to exactly 50 cubic centimetres by adding water, well shaken and filtered, and the filtrate is poured into the polariscope-tube.

The receipts of sugar during 1882 and 1883 were as follow:

IMPORTED FROM	1883.	1882.
	Tons.	Tons.
Cuba.....	425,481	502,410
British West India islands...	45,788	25,710

French West India islands..	32,780	28,649
Porto Rico.....	46,526	84,698
St. Croix.....	902	1,537
Demerara.....	50,614	84,519
Central America.....	476	971
Bahize.....	888	605
Surinam.....	1,837	1,944
Mexico.....	878	430
Haiti and San Domingo.....	11,759	12,017
Brazil.....	91,848	81,029
Peru.....	1,187	560
Europe.....	45,889	7,204
Philippine islands.....	109,051	75,684
Java.....	576	5,422
China.....	7,698	8,827
Singapore.....	695	364
Other countries.....	7,759	9,801
Foreign.....	920,090	884,135
Domestic.....	4,866	5,296
Total.....	924,476	889,431

Of this quantity there was received at—

	1883.	1882.
	Tons.	Tons.
New York.....	637,058	575,330
Boston.....	205,738	190,524
Philadelphia.....	78,066	69,506
Baltimore.....	8,619	4,091
Total.....	924,476	839,451

In addition to the foregoing, about 13,380 tons were received at Portland, New Haven, and other Eastern ports, mostly from Cuba and Porto Rico. At New Orleans and other Southern ports 3,886 tons were received from Cuba, etc. The total receipts of cane-sugar were 941,742 tons. The effect of the new tariff is felt in the increased receipts of sugars of a lower grade. Large quantities of these inferior sugars, coming both from the East and the West Indies, are now refined in this country; formerly they were sent to England. The result of this increased importation has been the lowering of the price; and the condition of the market during the year is described as dull and depressed. In January the price of fair refining sugar was 6½ cents; this advanced to 7½ cents in May, and has since steadily declined till it closed in December at 6½ cents.

The low prices and greater importation of raw sugar show an increased consumption for 1883 of 86,482 tons over that of 1882, which, on a basis of a population of 55,000,000, shows a per capita consumption of 47½ pounds against 45½ pounds for last year.

The crop of cane-sugar produced in the Southern States, during the season of 1882-'83, was the largest obtained since the war. In Louisiana the yield was 241,220 hogsheads, or 135,298 tons, which, compared with 122,982 hogsheads, or 71,373 tons, shows an increase of 118,238 hogsheads, or 63,925 tons, over last year. From the remaining Southern States the product was about 7,000 tons, making a total of 142,298 tons of domestic cane-sugar. The crop for the season of 1883-'84 is estimated at 240,000 hogsheads, which is lower than that of the preceding season. At San Francisco the importations of sugar have largely increased during the present year, as the following figures show:

RECEIVED FROM	1883.	1882.
	Pounds.	Pounds.
Sandwich Islands.....	108,942,000	97,920,670

Peru.....	600
Mexico.....	48,417
Total.....	180,574,267	102,060,209

Beet-Sugar.—The production of beet-sugar in this country has of late been very unsatisfactory. In 1880 there were six factories in active operation, while at present but one refinery is working, the Standard Sugar Manufacturing Company of Alvarado, Cal. The

out-put of this establishment is given as 1,200,000 pounds for 1883, against 1,000,000 for the previous year. The difficulty experienced by those who have attempted to produce sugar from the beet in the East, has been the impossibility of inducing farmers to cultivate the beet-root at prices which the factories could afford to pay. The beet-crop in Europe was unusually large during 1882-'83, and the production is given by Licht as follows:

	Tons.
Germany.....	798,124
France.....	423,194
Austria.....	473,000
Russia.....	260,000
Belgium.....	82,738
Holland, etc.....	35,000
Total.....	2,082,000

As the beet-sugar coming to this country is exported almost entirely through German ports, it is impossible to ascertain exactly where it comes from, but it is supposed to be the surplus stock of Austria and Germany. The following data show the receipts of beet-sugar at the port of New York, with their corresponding polariscopic test, for the last three months of 1883:

October.....	1,007 bags, testing 91 degrees.
November.....	14,793 bags, testing 93 degrees.
December.....	73,996 bags, testing 94 degrees.

The second product consisted of—

October.....	300 bags, testing 84 degrees.
November.....	7,701 bags, testing 87 degrees.
December.....	8,594 bags, testing 88 degrees.

Maple-Sugar.—It is impossible to estimate, except very roughly, the crop of maple-sugar, not only because no data are available concerning its manufacture, but also for the reason that large amounts of a spurious article are thrown on the market and openly sold as maple-sugar. More of this sugar is produced in Vermont than in any other section of the country, and during the past year the cold weather and heavy snows have materially decreased the out-put. In 1882 the total product, East and West, was estimated at 20,000 tons, but in 1883 not more than 18,500 tons were manufactured.

Starch-Sugar.—The manufacture of sugar and sirup from starch derived from corn is an industry of comparatively recent origin. In 1863, at Buffalo, F. W. Geesling and Lyman Bradley began the manufacture of this product, and in 1864 the first patent on this subject was issued for the process which they devised. At present the starch-sugar industry in the United States gives employment to 29 factories, having an estimated capital of \$5,000,000, consuming about 40,000 bushels of corn a day, and producing grape-sugar and glucose to the annual value of nearly \$10,000,000. The process of making starch-sugar consists, first, in separating the starch from the corn by soaking, grinding, straining, and settling; and second, in converting the starch into sugar by the action of dilute sulphuric acid, this acid being subsequently removed by the action of chalk. To make the solid "grape-sugar," the conversion is carried further than to make liquid "glu-

cose." After clarifying, the liquid is concentrated in vacuum-pans and is decolorized with bone-black. Starch-sugar is chiefly used in making table-sirup, in brewing beer as a substitute for malt, and in adulterating cane-sugar. It is also used to replace cane-sugar in confectionery, in canning fruits, in making fruit-jellies, and in cooking. Artificial honey is made with it, and so also is vinegar. In response to a request by the Commissioner of Internal Revenue, in regard to the status of glucose, the following statement was prepared by the National Academy of Sciences:

That the manufacture of sugar from starch is a long-established industry, scientifically valuable and commercially important.

That the processes which it employs at the present time are unobjectionable in their character, and leave the product uncontaminated.

That starch-sugar thus made and sent into commerce is of exceptional purity and uniformity of composition, and contains no injurious substances; and

That though having at best only about two thirds the sweetening power of cane-sugar, yet starch-sugar is in no way inferior to cane-sugar in healthfulness, there being no evidence before the committee that maize-starch sugar, either in its normal condition or fermented, has any deleterious effect upon the system, even when taken in large quantities.

Sorghum-Sugar.—Since 1878, considerable interest has been developed in the cultivation of sorghum (*Sorghum vulgare*) for the production of sugar. Largely through the influence exerted by the Chemist of the Agricultural Department at Washington, numerous experiments were made, all of which have tended to demonstrate the practicability of obtaining sugar from this source. Only estimates of the quantity annually produced are available. The following works are in active operation: The Yates County Sugar Company, at Penn Yan, N. Y.; the refineries at Rio Grande, N. J.; at Champaign, Ill.; at Stirling and at Hutchinson, Kan. At the last four the production during 1888 is said to have exceeded 200,000 pounds each. At Dundee, Kinsley, and Lawrence, Kan., are works whose out-put was about 10,000 pounds each; making a total of 880,000 pounds.

SURGERY. Antiseptics.—The whole practice of surgery has undergone a radical change during the past few years, because of the influence of the germ theory of disease. This theory—the theory of Pasteur—may be briefly stated as follows: "Wherever there is decomposition of an organic liquid or solid substance, such decomposition is caused by the physiological action of living beings, the germs of which pullulate in the air. Wherever a wound is made, air penetrates, and, with the air, germs, which have the power of developing themselves, even in the interior of blood-vessels, where the circulation carries them. Hence result inflammations of the lymphatics and of the veins, erysipelas, gangrene, etc. The more cutting the instrument with which the operations are performed, the more freely are the vessels divided, the better do the germs penetrate, the more easily do microphytes and

microzoa cause complications, especially in loose and vascular tissues."

This theory—for it is still a theory—though it met with little favor in the country where it originated, was unhesitatingly adopted by a distinguished British surgeon, Mr. Lister, and by certain leading German surgeons—Volkmann, von Nusebaum, and König—and the practice based upon it has added a new word to surgical literature. "Listerism" is the practice of Mr. Lister, based upon his acceptance of Pasteur's theory of the origin of many surgical diseases. It consists in a systematic endeavor to prevent the access of air, and therefore of germs contained in the air, into wounds; and to destroy any germs which may have entered. Carbolic acid was the germicide upon which he placed his main reliance, and all wounds were immersed in it, and all operations were performed in its vapor instead of in the air. The most essential part of every operation became a spray-apparatus, which should surround the tissues to be operated upon with a vapor of carbolic acid. The surgeon himself, his assistants, the instruments used, everything which could possibly convey a microscopic germ into a wound, was thoroughly impregnated with the germicide, and after this the wound was dressed with an absolutely impermeable complicated dressing composed of many layers of different materials, each adding to the wished-for result—the avoidance of the entrance of air. When it became necessary to open a wound which had once been dressed, the same elaborate performance was repeated, and the part could only be inspected and examined under a covering of carbolic acid, either in the form of a solution or of spray. This is what is now understood by antiseptic surgery, by Listerism, and this it is that has to so great a degree modified the surgery of the day. The practical details of the treatment have been modified from time to time; other antiseptics, such as the bichloride of mercury, thymol, and eucalyptol, have been substituted for carbolic acid; the dressings have been changed in various ways, both by Mr. Lister and his followers, but the essential features of the treatment remain.

In this article we have to deal rather with the antiseptic treatment of wounds than with Pasteur's germ theory upon which it rests. Good practice may result from false theory, and Mr. Gamgee is not alone when he says: "That infection is always floating in the atmosphere, ready to settle, in the shape of impalpable and implacable germs, into any breach which may be made in the surface of a living body, is an idea which has never troubled me. The prescription, inspired by that idea, to rub strong carbolic acid into the innermost recesses of a compound fracture, to pursue and kill the germs; the warning that an antiseptic dressing may lose all its potency through a hole no bigger than a pin's point, in the investing Mackintosh, admitting countless germs; that a dress-

ing must be changed as soon as a little discharge permeates it, lest a septic channel be established for the ubiquitous and maleficent vibrios; that these will settle down, as a swarm from the air, on a granulating sore, if the spray be not kept in action while it is dressed—are (I say it with the sincerest respect) questionable propositions."

Irrespective of the theory upon which it was based, the results of the practice of antiseptic surgery were at once subjected to a rigorous comparison with the results of surgery without antiseptics, or with modified antiseptic treatment, and the discussion assumed considerable acrimony. For many months the various medical journals abounded in statistics of the treatment of wounds by the old and the new method. Mr. MacCormac reported forty-five operations for the division of various bones for the removal of deformity, thirty of which involved the knee-joint, and every one of which "recovered in the speediest, easiest, and safest manner possible." All his cases of compound fracture (fracture combined with a wound of the soft parts, allowing the entrance of air) recovered, except one, and those of the leg almost as though they had been simple; and so on through all the range of major surgical operations. He says:

Is there any other method—even that with the "simplest, safest, best of antiseptics," clean water—which will permit the surgeon to view a mass of dead blood lying in an open wound being transformed day by day before his eyes into living tissue? If this be true, and I suppose its truth will not be denied; if the great joints may be opened with absolute impunity by the surgeon's knife; if such formerly fatal injuries as gunshot wounds of the knee may be saved amid the difficulties of an army in the field; if ovariectomy be made more successful in the hands of experts, who operate on such cases by hundreds, and, what is to my thinking more important, the operation is rendered safer and more successful in the hands of other surgeons; if, in injuries of the head, in ordinary amputations and excisions, and operations of various kinds in compound fractures, not only is the risk of life diminished, but the recovery of the patient marked by a minimum of pain, fever, and suppuration—then a gain has been accomplished for surgery which it is scarcely possible to characterize; and I do not know which to admire the more, the scientific mind that has grasped a great principle and applied it, or the character of the man who has unswervingly pursued the object of his life, patiently perfecting, one by one, the means adapted to secure the end in view.

This may be regarded as a glowing tribute to Mr. Lister and to Pasteur by one who accepts entirely the practice of the former and the theory of the latter, and there are many surgeons who come within this class. There are many others, however, who hold modified views. For example, Mr. Holmes, arguing on the basis of 162 compound fractures treated to their conclusion, admits the great improvement observed in the results of injuries and operations since Mr. Lister began his attempts to secure the healing of wounds without putrefaction; but denies that this is due entirely to the method itself, since it is noted in the practice of those who repudiate Mr. Lister's

teachings. He thinks that all wounds and injuries are now much more carefully treated than they were some years since; and the effect of such increased care must show itself in the practice of those who follow the old methods of treatment, as well as of those who have adopted the new system. The question is, whether the results of the antiseptic system are so decidedly superior to those of other methods of treatment as to show that it is the only system adapted for general use in hospitals. The fractures occurring in St. George's Hospital, on which Mr. Holmes's statistics were based, were treated by no one method to the exclusion of others, his idea having been to give all methods a fair trial, and thus form an unbiased judgment as to the worth of the antiseptic method in particular. The result was, that he formed a strong general impression that the antiseptic method is superior to the others, at any rate during the dangerous period following the injury, in which the occurrence of surgical fever is so common under ordinary treatment, and during which erysipelas, diffuse inflammation, sloughing, extensive suppuration, and general blood-poisoning are so common.

The views are those of the greater number of the surgeons of to-day. The best results obtained by the strictest antiseptic treatment may be matched in individual cases by as good results obtained by almost no treatment, but on the whole there has been a vast improvement since Mr. Lister began to teach the use of the spray, though this improvement is not entirely due to the spray. It is found equally in hospitals where antiseptic surgery as taught by Lister has never been practiced. True antiseptic surgery is much older than Mr. Lister, though this in no wise detracts from the debt of gratitude the world owes to him for recalling and insisting upon its real value. There are also other antiseptics more powerful than carbolic acid and impermeable dressings. In the words of Mr. Gamgee, "Life and putrefaction are not correlative, but antagonistic; and, in proportion as the surgeon utilizes and economizes the attributes of life, he will find himself independent of those changes which are inherent in decaying organic matter; whether it be in bagging wounds or boggy lands, Life is the great antiseptic. Preserve it, restore healthy function, control by rest, position, and pressure, nervous, vascular, and muscular action, so as to minimize the material for and the causes of discharge, carry this off as it is produced, by drainage-tubes and absorbent dressings, and the repair of injuries proceeds, like healthy nutrition, uninterruptedly and painlessly." In addition to these things, the antiseptic properties of the balsamic preparations, of turpentine and resinous gums, of alcohol, bark, and acids, have been utilized in wound-treatment for generations.

Thus, then, as a result of theory and practice, the surgery of to-day has reached a stage in

which the greatest possible care is given to the details of cleanliness, the prevention of putrefaction, the avoidance of any collection of pus in wounds by drainage, and to the securing of absolute rest to injured parts. The extent to which absolute cleanliness may be carried, and the good results of such care, are shown by the answer Volkmann makes to the question whether a surgeon or obstetrician is justified in making an autopsy. His answer is affirmative, but with many restrictions which would have seemed ridiculous a few years ago. It is evident that the infection-material which necessarily attaches to the surgeon in making an autopsy can do no good in a wound, and, therefore, a general surgeon should not come in contact with ulcers, wounds, sensitive mucous membranes, as those of the eye, or make vaginal examinations of pregnant or puerperal women, until a suitable time has elapsed since an autopsy, or until he has carefully disinfected himself and the instruments he employs. Since 1878 no diseases arising from accidental wound-poisoning have arisen in Volkmann's clinic. Since that time every nurse and assistant has submitted to careful disinfection before touching any breach of surface, no matter how trifling. All sounds used for exploration, and even scissors used for cutting sutures in wounds not treated antiseptically, are first disinfected. During this period the slighter forms of phlegmon have entirely ceased, and erysipelas is only rarely seen in its so-called spontaneous form. Visitors going through his wards and seeing recent wounds on the face treated by the open method, without any inflammatory action being visible, have remarked that the wards must be so entirely carbolized that all wounds heal readily; or that such cases show what good results may be obtained by the old method. Both conclusions are incorrect, for all the cases were treated on the antiseptic plan, the occlusion dressing alone being omitted. In every case, in every part of every operation, the causes of putrefaction are excluded. So thoroughly are his best nurses imbued with this idea that they disinfect the scissors with which they cut off the plaster bandage from a simple fracture. His own practice is to use a five-per-cent. solution of carbolic acid freely for washing. He does not consider it necessary to go to the extent of changing the linen; but, for operations and dressings, both he and his assistants put on white linen coats, and of these he often uses three or four for himself of a morning. He discards the old cloth operating-gowns, and does not approve of the water-proof sleeves and aprons. By this means he is enabled to deliver his course on operative surgery from six to eight o'clock in the morning, during which his hands are constantly in the blood and fluids of fresh and putrid subjects, and then occupy himself immediately with operations on the living and with fresh wounds, without carrying infection. He thinks it much better to disinfect a visitor

and to dress him in a fresh, clean gown, than to trust to his assertion that for a certain number of days he has not been exposed to putrid influences. If it were not possible thus rapidly and yet thoroughly to purify one's self, it would be necessary to establish special stations and special assistants for all patients whose wounds were not entirely free from any septic character; for every surgeon is liable to be called from a foul wound or a septic inflammation to give immediate attention to some case particularly susceptible to septic influences. At first he felt great anxiety on this point; the bad cases were all isolated, and their dressings were postponed till the last, and, after finishing, his assistant took a bath and changed all his clothes. Now the only cases isolated are erysipelas, diphtheria, and the like. Where he has a long series of operations, he begins with those in which the danger of infection is greatest, and ends with those already suffering from septic disease. First he opens a peritonæum, then removes a loose body from the knee, then excises diseased joints, and finally comes to the acute progressive inflammation.

Drainage.—One of the most potent influences for evil in wounds is the accumulation of fluids in sacs or pouches of the tissues which may become putrid, and, by being absorbed into the circulation of the blood, produce general blood-poisoning and death. This difficulty has also been in a great measure overcome by the adoption of a system of drainage of wounds which has already been referred to. Small soft-rubber tubes, with numerous perforations in the end, are introduced into all the deeper parts of wounds, to allow of the constant escape of the fluids. When these do not answer the purpose, or can not be introduced into the necessary parts of the wound, the latter may be enlarged to permit of their introduction, or entirely new openings in the tissues may be made for no other purpose than to allow of the free escape of matter. For example, in a bad fracture of the thigh by a bullet entering from before, the patient must of necessity be placed upon his back, and all the fluids of the wound tend naturally to gravitate toward the back of the limb and to form pockets and pouches for themselves, where they remain and undergo putrefaction. In such a case it is not uncommon to make another opening in the back of the thigh, communicating with the fracture, for the sole purpose of discharge. The increased injury is trifling, and the good can not be estimated.

Under the influence of these two principles, perfect cleanliness and free drainage, almost a revolution has occurred in surgery within the past few years. Operations are performed successfully to-day which three years ago it was considered necessarily fatal to undertake. It is but a few years since a wound of the abdominal cavity was looked upon as almost sure to produce an inflammation of the delicate internal covering of that cavity and of the in-

testines—the peritonæum—and peritonitis was almost necessarily fatal. The peritonæum is now opened with impunity whenever occasion seems to justify it, and even as a means of diagnosis. If, after the opening is made, the diagnosis is confirmed, the operation, whatever it may be, is completed; if the diagnosis be not confirmed, or the condition be found to be incurable, the wound is cleansed and closed, and the patient is but little worse than if the abdomen had not been opened. This discovery of the comparative impunity with which the abdomen may be explored has opened to the range of the surgeon an entirely new field of work. All of the abdominal organs were a few years ago considered beyond the reach of surgical interference; now almost every one of them may be, and indeed has been, reached by the surgeon's knife and hand; and entirely new surgical operations, by which many lives have been saved, are the result, a few of which may be enumerated.

Operations upon the Alimentary Canal.—The number of successful operations which may be practiced for diseases of various parts of the alimentary canal has increased greatly. Beginning with the stomach, it is now not an unusual thing to open successfully the abdomen, seize the stomach, stitch it to the wall of the abdomen, open into it, and thus establish a means of conveying food into the system when the natural channel of the gullet has been occluded by disease at some point between the mouth and the stomach. In this way a person may be fed for any length of time, as has always been known; but the operation for opening the stomach, formerly so fatal, has now become comparatively successful.

By a very similar operation a cancer of the stomach may be removed, the opening caused by its removal closed with stitches, the organ returned to its place, and the abdomen closed, with a successful result. It is not an uncommon thing for the bowel to become closed at some part of its length by disease, or to become so twisted upon itself that its caliber shall be occluded, and the condition is necessarily fatal unless it be remedied. Only a few years ago these cases were treated medicinally, and those which did not recover, either spontaneously through the efforts of nature or as a result of general treatment, were lost. No surgeon dared to cut into a patient's abdomen, find out by actual exploration with the hand the exact nature of the obstruction, and endeavor to relieve it. These operations have now become exceedingly frequent. If, from the symptoms, the surgeon is led to believe that the bowel has become twisted upon itself, he opens the abdomen, first of all to discover if his opinion be correct; if correct, he gives what relief he can, and often directly saves a life. If the disease prove to be a stricture or contraction of some portion, he may be able to relieve the condition; if a cancer of the bowel be found, it may be cut out and the two ends above and below the

disease stitched together; if the condition be found to be entirely unrelievable (for the diagnosis of these troubles is exceedingly difficult), the wound in the abdomen may be closed and the patient's chances of recovery be none the less.

M. Kœberlé recently reported the most successful case of excision of a portion of the intestine that has thus far been brought to the notice of the profession. The patient was a girl, aged twenty-two years, who had suffered for a long time with symptoms of intestinal obstruction, though the symptoms were not such as enabled him to arrive at any satisfactory conclusion as to the exact pathological condition. As the trouble was steadily increasing in severity, and the patient losing ground from suffering and malnutrition, an exploratory incision was made in the median line of the abdomen. Four cicatricial contractions were discovered in the small intestine, involving between them about two metres of the bowel, and the whole affected portion was consequently removed rather than retire from the operation and leave the patient to certain death. The result was a perfect success, and established several points which were before doubtful. It proves among other things that considerable portions of the small intestine may be removed without interfering to any appreciable extent with digestion, and that, practiced under certain conditions, the operation is to be considered as perfectly legitimate.

The operation of excision has also been applied to cancers of the large intestine, the sigmoid flexure, and the upper part of the rectum. This operation, to which the name of "colectomy" has been applied, has now assumed a definite place in surgery. It dates from the time of Reybard, of Lyons, who in 1833 removed a tumor the size of an orange from the sigmoid flexure of a man aged twenty-eight years. In this case the tumor could be felt through the abdominal wall, far down on the left side, and an incision was made over it. The tumor was drawn out through this wound and excised with three inches of the adjoining intestine. The two ends of the bowel were stitched together and replaced within the abdomen, and the abdominal wound was completely closed. There was considerable local trouble for a few days, but on the thirty-eighth day the wound had entirely healed, and natural passages were restored. The operation thus successfully inaugurated in 1833 was revived in 1877, with some modifications, especially as to the best point for making the incision, and as to the best way of disposing of the cut ends of the bowel after the removal of the disease; since which time seven additional cases have been reported. There seems to be little difference in the mortality, whether the ends of the divided intestine be sewed together, dropped into the abdominal cavity, and the wound in the abdomen closed, or the upper end be stitched to the surface of the body at

the seat of the incision for the formation of an artificial anus. The latter is the simpler procedure, and the lower segment of the bowel, being closed with a ligature, is dropped back into the abdomen and left to nature.

A bullet-wound of the intestines has always been considered one of the most fatal of injuries. The following account illustrates the difference between the surgery of to-day and that of a few years ago, when to interfere actively in any way with such a case would have been considered hardly less than criminal. A man is shot in the abdomen between the navel and the pubes. He is not seen by the surgeon until nine hours have passed, when the abdomen is found distended and painful, and a wound of the intestine is distinctly made out. Opening of the abdomen gives the only chance of saving the patient's life, and this is done with all the modern antiseptic precautions. The intestines are examined, and five perforations of the smaller bowel and two of the mesentery are discovered. The edges of all the wounds are vivified with the scissors and all are sewed up with silk, rendered antiseptic by soaking in a solution of phenol. The abdominal cavity is then thoroughly cleansed of blood and fecal matter, and a drainage-tube inserted into the lower end of the wound. The patient died three days after. At the autopsy it was found that all the wounds which had been sewed up were healing nicely, but one had escaped observation and had caused death.

Hernia.—The operation for the radical cure of hernia, or rupture, has attained considerable prominence. In many cases, by a comparatively trivial operation, which consists in the injection of a small quantity of an irritating fluid, like the tincture of white-oak bark, into the tissue over the canal through which the hernia descends, an amount of irritation is excited just sufficient to cause an adhesive inflammation in the canal, and thus close it. In this way a disease which a few years ago was only curable by a severe and dangerous surgical operation, and which on this account was simply treated with a truss, without any expectation of a cure, is now often radically cured. For this discovery, surgery is indebted to Dr. Heaton, of Boston, who practiced it successfully but secretly during his lifetime.

Hæmorrhoids.—The exceedingly common and troublesome disease known as hæmorrhoids, or piles, was formerly curable only by operations which removed the tumors, such as cutting them off with a knife, tying them off with a ligature, or destroying them with powerful caustics. This treatment also has been radically changed, and an equally efficient method of cure by injections has been discovered, which is almost painless, is devoid of danger, and free from the objections generally considered inseparable from a surgical operation.

Not only has the alimentary canal for its entire length thus been brought within the range of successful operative measures for the

relief of incurable disease, but all the other organs contained within the abdominal cavity have each in their turn been reached by the hand of the surgeon.

Operations upon the Liver.—Abscess of the liver was formerly very fatal, owing to the unapproachable position of the pus, which, though beyond the reach of the surgeon, might at any moment be discharged into the abdominal cavity and cause death. A few years since it was found that a very fine hollow needle might be plunged into the liver with comparative safety; that to this an air-pump might be attached, and the abscess emptied of its contents by suction. This was in itself a great advance; but now, when an abscess is suspected, the needle is boldly plunged into the organ as a means of exploration. If pus is found, the region over the liver is cleansed with a disinfecting solution, the needle is allowed to remain as a guide, and an incision is made through the abdominal wall into the liver till the pus is reached. The cavity of the abscess is next washed out with a disinfectant, a large drainage-tube is inserted, and the wound is covered with an antiseptic dressing. This dressing is changed daily. Each time the tube is cleaned and replaced, and the abscess is forced in this way to close, as an abscess in any other part of the body would, by a gradual healing from the bottom.

Splenectomy.—This is another of the great operations of surgery which have become more prominent within the past few years. Though at first invariably fatal, it now numbers several successful cases. The operation is seldom undertaken except for the cure of a fatal disease known as leucocythæmia, which is marked by a great enlargement of the spleen, and by a great increase in the number of white corpuscles found in the blood. The change in the blood is supposed to depend upon the change in the spleen, and it is thought that if the spleen could be removed from the body the patient's life might possibly be saved. The operation is performed by opening the abdomen from near the end of the breast-bone to the pubes, drawing out the enlarged organ, which sometimes fills nearly the entire abdomen, placing a ligature around the vessels that supply it with blood, and cutting it loose. Although never but once successful in a case of leucocythæmia, it has often been done in cases of other disease with a favorable result.

Nephrotomy and Nephrectomy.—The number of cases in which surgeons have cut into the kidney, or have taken out the kidney, is now very considerable, while a few years ago the operation was a rarity. The kidney is subject to many incurable diseases, and especially to the formation of stone in its substance. Such a stone can be reached in no way except by the knife. An incision is made through the loin down to the diseased organ, and it is laid open. If the disease be calculus, this may be removed and the kidney left in its place; or, if the kid-

ney be found extensively diseased, it may itself be removed. Another affection until lately considered beyond the reach of help is what is known as floating kidney, in which the organ, on account of the laxity of its attachments, changes its position from one side of the abdomen to the other, and can easily be felt by the hands, first in one place, then in another. Such a condition is enough to render the sufferer's life of no value to himself, and justifies almost any attempts at relief. Up to a few years ago nearly all such attempts ended fatally. Now they are recognized as legitimate surgical operations, and are attended by a very fair percentage of success.

Excision of the Gall-Bladder.—Not at all an uncommon affection, and one which a few years since was entirely beyond relief, is the formation of gall-stones and their retention in the gall-bladder, where they cause an amount of suffering and inflammation often leading to death. In such cases the usual treatment now is to cut down upon the disease and not only to remove the calculus, but to remove the gall-bladder with it, and such operations are attended by exceedingly good results.

Rapid Lithotrity.—The old and well-known operation of crushing a stone in the bladder by seizing it with instruments especially designed for the purpose has been signally modified by Bigelow, of Boston. Formerly such an operation was only completed after several sittings, and was attended by great danger of inflammation from the presence of the sharp fragments resulting from the crushing. The operation is now done at a single sitting, the calculus is completely crushed, and all the fragments are removed before the patient leaves the table. This operation of "rapid lithotrity," as it is called, is not original with Dr. Bigelow, it having long been known though seldom practiced. But he has brought it again into popularity, and has added to the facility of its performance by the invention of a new instrument for drawing the fragments out of the bladder by the force of suction, after the crushing has been completed. The operation, as now practiced, constitutes one of the greatest advancements in the surgery of the bladder.

Drainage of Cavities in the Lungs.—To whom belongs the honor of first suggesting the bold plan of opening into cavities in the lungs of consumptive patients, and treating them on general surgical principles, is a question which will never be decided. Probably many men have considered the practicability of it without attempting it. Recently it has been accomplished with a considerable measure of success. The walls of such cavities are generally adherent to the chest-wall, and may be opened into without any immediate danger; and there would seem to be no reason in the nature of the case why, when such a cavity is laid open, cleaned out, drained, and properly dressed, it should not heal. The number of cases in which drainage has been resorted to is consid-

erable, and, although only a few have resulted in the entire recovery of the patient, most of them have been sufficiently relieved to justify the operation. A soft drainage-tube is introduced into the bottom of the cavity, which is syringed out daily with carbolic acid, while the wound is dressed antiseptically.

Internal Illumination of the Body.—The desire to see within the body for the purposes of diagnosis is a very natural one to the surgeon, and with modern instruments much may be seen which formerly could only be guessed at. With the laryngoscope, for example, the whole action of the larynx, the production of sound, and morbid processes down to the bifurcation of the trachea, may be exposed to the eye; as with the ophthalmoscope the deeper parts of the eye may be examined. Milliot, in 1867, invented an instrument for lighting up the abdominal cavity so that its contents could be seen through the abdominal wall, but only used it on animals and dead bodies. His experiments led Lazarewitch to apply the same thing to gynecology. He, however, failed to get light without at the same time getting an amount of heat which rendered the instrument both useless and dangerous. More recently Dr. Nietze, of Vienna, originated the idea of illuminating the interior of the bladder by passing into it a white-hot platinum wire, and the idea has been practically carried out by Leitner, the surgical-instrument maker of that city; hence the name Nietze-Leitner endoscope. The instrument consists of a platinum wire heated by electricity, and surrounded by a current of water to keep it from burning the tissues. Sir Henry Thompson, though speaking very cautiously, says there are some conditions the existence of which we sometimes suspect, but can not positively affirm to exist, whose presence may now be ascertained by this instrument. He refers to the identification of sacculated stone as the cause of existing and unrelieved symptoms; to the detection of growths removable by operation; and to the investigation of the nature of foreign bodies other than calculi which have become lodged there. He says he has recently seen a fatal case of vesical growth which might have been easily removed by operation; and in such a case the new endoscope may possibly render essential service.

Carbolic-acid Poisoning.—The almost universal use of carbolic acid as an antiseptic for the dressing of wounds has resulted in the knowledge of a peculiar form of poisoning. It has been proved that too much of the acid applied to an open sore may be absorbed into the circulation and cause death, with high temperature, a peculiar dark, smoky appearance of the urine, convulsions, and symptoms of heart-trouble. The peculiar diagnostic appearance of the urine is supposed to be due to an escape of the coloring-matter of the blood in the form of indican. Carbolic acid, when taken into the circulation, is quickly eliminated by the kid-

neys, at the expense of a great deal of irritation and congestion of the organ. The poisonous effects of the acid may occur in a certain small number of cases, in spite of the best management, and in such cases is the result of a rare idiosyncrasy in those affected. Several interesting cases may be cited in proof of this statement. One in particular, from the practice of Dr. Whiteford, which shows the peculiar susceptibility possessed by the members of some families, and also the small quantity which will sometimes suffice to produce symptoms of poisoning. Two children of one family came under his care suffering from ringworm of the scalp. The treatment in both cases was a two- and -a-half-per-cent. solution of carbolic acid applied in the form of a water-dressing. In both, symptoms of poisoning occurred, in one case exceedingly severe, and coming on very shortly after the first application, while in the other the symptoms were delayed for two days and were altogether less severe. Removal of the acid removed all the symptoms in both cases. To satisfy his mind that the acid was really at fault, and that the symptoms were not merely a coincidence, he repeated the experiment twice in each case—once to the scalp, as before, and again to another part of the body—with the result of bringing back the urinary and gastric disturbances and the other symptoms of carbolic irritation. In none of these applications did the size of the portion of the skin in contact with the acid exceed that of a half-dollar. The result of the study of these cases has been to diminish the strength of the solutions of carbolic acid, as well as the frequency of their application, and also to substitute other substances which answer the purpose even better and are attended with less danger, such as eucalyptus globulus, acetate of aluminum, and bichloride of mercury.

Erysipelas.—The proof of the pathogenic nature of the micrococci of erysipelas has been given by Fehleisen, who has not only found them present in all cases of erysipelas examined during life, but also cultivated them, and with equal success inoculated the cultivated organisms in animals and in man. In small portions of skin excised from the diseased part in patients suffering with erysipelas he found in all cases numerous micrococci arranged in chains. They were especially abundant in the parts most recently affected; and here they were found most abundantly in the superficial layer of the corium and in the subcutaneous adipose tissue, filling the lymphatics and the lymph-spaces, while the rest of the tissue showed a cell-infiltration. Contrary to the older observers, they were never found in the blood-vessels. To prove that their presence was not merely accidental, Fehleisen cultivated some small excised portions of skin on gelatin, after carefully disinfecting the affected part, and succeeded, in the course of two months, in producing fourteen generations. The cultivated micrococci formed a whitish film, easily de-

tached from the surface of the gelatin, and consisting entirely of the specific micrococcus. Nine rabbits were inoculated on the ears with the pure and cultivated organisms. In one the effect was merely a slight elevation of temperature; in all the others, after thirty-six to forty-eight hours, the temperature rose, and a characteristic erysipelatous rash appeared and gradually extended to the root of the ear, and thence spread to the head and neck. Within eight days the disease had run its course, and the animal recovered. Not one of the animals died. The light-red color of the affected part, the absence of œdema or suppuration, and the presence of the micrococci in the lymphatics of the affected part (seen in one case where the ear was amputated during the height of the disease), showed that the affection was true erysipelas, and not septicæmia.

More valuable still to show the etiological importance of the micrococci in erysipelas are the inoculations on man. (Such a proceeding was perfectly justifiable, when it is considered that many of the older surgeons have quoted cases showing the curative and beneficial effect of erysipelas when occurring in cases of a more serious nature, as cancer and lupus.) Fehleisen inoculated the pure and cultivated micrococci in seven patients, all suffering from severe and incurable disease. Six out of the seven cases showed, after a period of incubation varying from 15 to 60 hours, typical erysipelas, setting in with chills and high temperature, and running the characteristic course. In some the symptoms were very severe, in one there was threatening collapse, and one was complicated with pleurisy, which, however, soon subsided. As regards the therapeutic effect, the inoculations are of some interest. One case of lupus was almost entirely cured. In another case the cancerous tumors completely disappeared, and there had been no recurrence.

The effect of antiseptics on the vitality of the micrococci was also tried. Two substances only were experimented with—carbolic acid and corrosive sublimate. A three-per-cent. solution of the former stopped the growth of the micrococci after a contact of 45 seconds, while the same effect was produced in 15 seconds with a one-per-cent. solution of the corrosive sublimate. The list of diseases due to a specific organism is thus increased by one.

SWEDEN AND NORWAY, two kingdoms occupying the Scandinavian Peninsula in Northern Europe, united indissolubly, by the Riksaact of 1815, in the person of the sovereign. Succession to the throne is hereditary in the house of Ponte Corvo. The throne is to be filled, in case of absolute vacancy, by the joint action of the two Parliaments. The common affairs of both kingdoms are decided upon by a Council of State.

The reigning King is Oscar II, born Jan. 21, 1829, grandson of Marshal Bernadotte, and the fourth sovereign of the line.

SWEDEN. Constitution.—The legislative pow-

ers are vested in the Diet, subject to the approval of the King, save in matters of political administration and taxation, the former of which is the exclusive province of the sovereign, and the latter that of the Diet. The Diet consists of two chambers, both elective. The franchise is limited by a property qualification.

Area and Population.—The area of Sweden is 170,979 square miles. The population in 1880 was 4,565,668. The estimated population on Dec. 31, 1882, was 4,579,115. The mean annual emigration in 1851-60 was 1,690; in 1861-70, 12,245; in 1871, 17,450; in 1872, 15,915; in 1873, 13,580; in 1874, 7,791; in 1875, 9,727; in 1876, 9,418; in 1877, 7,610; in 1878, 9,082; in 1879, 17,637; in 1880, 42,109; in 1881, 45,992.

Commerce.—The imports increased from 82,469,000 crowns, in 1860, to 288,060,000 in 1881; the exports from 86,496,000 to 223,196,000 crowns (1 crown=26·8 cents). The imports from the United States in 1881 amounted to 9,820,000 crowns; exports to the United States, 355,000 crowns. The staple articles of export are timber, pig-iron, and grain. The leading imports are textile manufactures, coal, and colonial merchandise, the latter largely on the increase.

The length of railroads in operation in 1881 was 3,830 miles, of which the state owned 1,365 miles. The length of telegraph lines was 7,210 miles; of wires, 18,880 miles. The number of letters and journals carried by post in 1881 was 68,731,121.

The Army.—The army is composed of five classes of troops: men enlisted for three, four, and six years, forming the guards, hussars, artillery, and engineers; the *Indelta*, who are enlisted for life and cantoned on the estates of the land-owners; the *Gothland* militia, not liable to service outside of the island; the conscripted troops, who are called out annually for 15 days; and the volunteer rifle corps, in 1881 numbering 11,065 men. The total strength of the army in 1883 was 182,572 officers and men, with 836 guns and 6,649 horses.

Finances.—The ordinary receipts of the treasury are estimated in the budget for 1884 at 21,270,000 crowns; the balance carried over from former years, 4,100,000 crowns; net receipts of the Bank of Sweden, 1,300,000 crowns; extraordinary receipts, 52,340,000 crowns; total, 79,010,000 crowns. The ordinary expenditures are estimated at 59,135,665 crowns; extraordinary expenditures, 8,221,385 crowns; expenditures on account of the public debt, 10,240,086 crowns; balance carried over, 1,412,964 crowns; total, 79,010,000 crowns. Not only a large part of the army, but a great number of the ecclesiastical functionaries, are paid wholly or in part from the produce of certain public domains. The expenses of public instruction are mainly borne by the communes and provinces.

Politics and Legislation.—For many years past

the Government has urged upon the Diet the necessity of army reorganization, without avail, until finally the question has been allowed to rest. The great land-owners, who control the vote of the First Chamber, are not in favor of a change, because the charge of the militia at present bears not so much on them as on the farming class; while the Land-men's party, who are in the majority in the popular house, are averse to the new system because it would greatly increase the burdens of the people. The financial returns for 1883 are favorable for the first time in a long period, and allow of a reduction in the coffee duty instead of the accustomed increase of taxation. In 1883 the stamp-duties were enhanced, and the tax on the manufacture of spirits increased.

NORWAY. Constitution.—The Grundlov of Nov. 4, 1814, vests the legislative power in the Storting. Laws passed in three Storthings can not again be vetoed. The King has command of the army and navy, and makes all civil appointments. Since 1869 the sessions of the Storting have been annual. All property-holders are electors. The members of the Storting are elected indirectly every three years. After assembling they divide themselves into two bodies, three fourths forming the *Odelsting*, which originates all bills; and the other fourth the *Lagthing*, which approves or rejects them.

The executive authority is exercised in the name of the King by a State Council, composed of two Ministers of State and at least seven councilors. Two councilors, who are changed annually, and one of the ministers, form a deputation residing near the person of the King, at Stockholm.

Area and Population.—The area of Norway is 122,869 square miles. The population in 1875 was 1,806,900, as compared with 1,701,365 in 1865. The town population in 1875 was 332,398, showing an increase of 24 per cent., against 4 per cent. in the rural districts. Emigration has assumed considerable proportions of late years, the movement being almost exclusively to the United States. The number of emigrants in 1871 was 12,276; in 1872, 13,865; in 1873, 10,352; in 1874, 4,601; in 1875, 4,048; in 1876, 4,355; in 1877, 3,206; in 1878, 4,863; in 1879, 7,608; in 1880, 20,212; in 1881, 25,976; in 1882, 28,804.

Commerce.—The average annual value of the imports in the five years, 1877-'81, was 161,300,000 crowns (one crown = 26·8 cents); of the exports, 102,800,000 crowns. The imports in 1882 amounted to 160,475,000 crowns. The imports from the United States were valued at 2,569,000 crowns; the exports to the United States at 156,000 crowns.

The tonnage entered at Norwegian ports in 1881 was 1,976,462 tons, of which 1,306,960 were Norwegian. The merchant fleet, which in proportion to population is the largest in the world, comprised in 1881 7,977 sail-vessels, of 1,520,404 tons, against 1,007,903 in 1870, and

859 steamers, of 65,627 tons. The number of sailors was 60,064.

The Army.—The troops are raised mainly by conscription. The military forces are divided into line troops, the train, the militia, or Landvaern, the civic guards, and the Landstorm, or final levy. All men of the age of twenty-two are liable to conscription. They are called out for practice only about thirty days each year, for a period of from three to five years. The active force is limited to 750 officers and 18,000 men, which numbers can only be exceeded by special act of the Storting.

Finances.—The receipts in 1882 amounted to 89,694,400 crowns from the ordinary revenue, and 8,687,900 crowns from extraordinary sources. The ordinary expenditures amounted to 89,850,800 crowns; the expenditures for railroad construction to 6,627,800 crowns.

The national debt on June 30, 1882, amounted to 106,124,000 crowns, the greater part bearing interest at $4\frac{1}{2}$ per cent., the last loan, contracted in 1880, at 4 per cent. The funds, railroad stock, and other assets of the state, exceeded the debt.

Political Crisis.—The Storting passed twice over the royal veto a bill to compel the ministers to be present at the sittings and to answer questions. The question raised by the Radical majority was that of the responsibility of the ministers, which had never before been brought to a practical issue. The King insisted on his appointing power and the absolute right to choose his own advisers, and therefore denied the jurisdiction of the Storting over matters pertaining to the executive. The last Storting was dissolved with an angry reproof. The new one contained a largely increased Radical majority. When the Storting was opened in February, by the King in person, the deputies showed an unbending spirit. The King not only contests the principle of ministerial responsibility, but desires to alter the Constitution of the country, and, in fact, deprive the Norwegian people of the cherished right to make their own laws. He proposes to reconstitute the Lagthing and transform it into a real Senate, which will act as a counterpoise to the popular chamber. In this he has with him the Conservative party, which is composed of a portion of the townspeople, and largely of the German and other foreign population in the few large towns of Norway; while he is opposed by the entire farming population, which composes the Liberal party. The King has persisted in selecting his ministers from the Conservative party, and exasperated the people by imposing upon them a Government at variance with the sentiment of the country. The point directly at issue in the constitutional struggle between the King and the people is the absolute veto which he claims over the acts of the Legislature. The ultra-monarchic principles which he endeavors to import into the extremely liberal Norwegian Constitution have excited a strong

reaction of feeling in favor of a republican form of government. The ministers still refused to occupy the seats placed for them in the legislative hall. In April, on the recommendation of the parliamentary committee, the Odelsting decided to impeach the ministers and Councilors of State. Toward the close of the year the tribunal, composed of certain members of the Lagthing and of the nine judges of the Supreme Court, was constituted, and the recalcitrant ministers were summoned to stand their trial.

SWEDENBORGIANS. See NEW JERUSALEM CHURCH.

SWITZERLAND, a federal republic in central Europe. The legislative and executive authority of the confederacy is vested in the State Council, composed of 44 members, chosen by the twenty-two cantons, and the National Council or Nationalrath, chosen by direct election at the rate of one member for every 20,000 inhabitants. Every male citizen over twenty years of age is a voter. Clergymen are not eligible. Both Chambers united form the Federal Assembly. The executive authority is delegated to the Bundesrath, or Federal Council, consisting of seven members, chosen for three years by the Federal Assembly. The President and Vice-President of the Federal Council are elected by the Federal Assembly for one year, and are not eligible for the next consecutive term.

The President of the Confederation for 1883 was L. Ruchonnet; the Vice-President, Dr. E. Welti. The other members are Dr. K. Schenk, W. F. Hertenstein, B. Hammer, N. Droz, and Dr. A. Deucher.

Area and Population.—The area of Switzerland is 41,889 square kilometres, or 15,992 square miles. The population, Dec. 1, 1880, was 2,846,102, against 2,669,188 in 1870. The number of Protestants was 1,667,109, or 58·6 per cent.; of Catholics, 1,160,782, or 40·8 per cent. of the total population; there were 7,378 Israelites, and 10,888 of other creeds. The number of emigrants in 1882 was 10,896, of whom 10,047 settled in the United States.

Education.—The number of elementary schools in Switzerland is 4,586; the number of pupils 484,080 in 1882; of teachers, 5,840 males and 2,525 females. Of the pupils, 218,191 were boys and 215,889 girls. Switzerland expends for primary instruction about 15,000,000 francs a year, and for new school-buildings about 3,000,000.

Railroads, Posts, Telegraphs.—The Swiss railroads in 1882 had a total length of 2,571 kilometres, or 1,594 miles. The length of telegraph lines was 6,744 kilometres at the end of 1882; length of wires, 16,336 kilometres. The post-office in 1882 forwarded 84,069,486 letters and post-cards, of which 57,872,718 were internal and 26,196,768 international.

Finances.—The gross receipts of the Federal treasury in 1882 were 43,736,106 francs; expenditures, 43,247,797 francs; receipts com-

puted in the budget for 1883, 48,382,000 francs; expenditures, 48,674,000 francs; the net receipts of the cantons in 1876, 89,743,726 francs; of the Confederation, 17,289,783 francs; total, 56,983,459 francs; the net disbursements of the cantons, 44,108,078 francs; of the Confederation, 18,303,499 francs; total, 62,406,572 francs. The total assets of the Confederation, Jan. 1, 1883, were 54,664,510 francs, and the total debts 36,457,895 francs, showing a surplus of 18,206,615 francs. The total amount of the cantonal debts in 1877 was 252,793,378, and of the assets 456,267,202 francs, making a reproductive public fortune of 203,473,829 francs; or, including the surplus capital of the Confederation at that time, of 208,074,891 francs.

The Army.—The Federal army is composed of the regular army (Bundesauszug), to which all are liable between the ages of twenty and thirty-two, and the reserve (Landwehr), which comprises all the male citizens between 33 and 44 years of age. The effective of the regular army, Jan. 1, 1883, was 114,620; of the reserve, 90,259 men; total, 205,176.

Religious Conflict.—In 1873 Monsignor Mermillod, the most active champion of Ultramontane doctrines, and one of the most eloquent and successful preachers in Switzerland, persuaded the Pope to renew the attempts made under his predecessors to separate the united sees of Lausanne and Geneva, and erect Geneva into an independent bishopric. Abbé Mermillod had built up the flourishing church of Notre Dame, and since 1864 officiated as auxiliary for Geneva, with the title of a bishop *in partibus*. The Federal Government refused to sanction the creation of a separate diocese of Geneva. The Holy See then constituted it a Catholic vicariate, and appointed Monsignor Mermillod apostolic vicar. He at once installed himself in the post, and paid no attention to protestations of the Federal Council. The Council then forbade him to discharge any ecclesiastical functions, and upon his continued disobedience issued a decree of banishment, and had him conducted across the frontier. The

Pope, in an encyclical note, Nov. 21, 1873, denounced the act as infamous, whereupon the Swiss Government, Dec. 12, 1873, broke off diplomatic intercourse with the Vatican.

The Old Catholic movement was then in its most flourishing stage, and the cantonal authorities endowed the schismatic branch with the diocesan subsidies, and attempted to establish it as the state church of the Catholic confession in 1876. This National Church, which obtained the official recognition of the Protestant legislators, dwindled away, while the strength and zeal of the Catholic community were stimulated. The animosities of the conflict between church and state subsided to a considerable extent in Switzerland, as in other lands, after the accession of Leo X. The re-establishment of the Catholic authorities in Geneva was a public necessity. The see of Lausanne and Geneva was left vacant by the death of the late incumbent in the beginning of 1883. The Pope first prepared the way for the restoration of normal conditions by abolishing the office of apostolic vicar, and then, in vindication of the course of the Curia, appointed Monsignor Mermillod Bishop of Lausanne and Geneva, announcing that he would reside in Freyburg, so as to avoid the revival of the old controversy. The appointment was at first greeted with violent remonstrances, but the Federal Government rescinded the decree of exile, and the authorities of Vaud, Neuchâtel, and Freyburg expressed themselves satisfied with the appointment, though Geneva still objected. He came back as the representative of a conciliatory policy, and surprised his old enemies by using his authority to repress the political activity of the clergy, and by favoring the liberal section of the church.

There were other difficulties between the civil and Catholic ecclesiastical authorities, in the diocese of Ticino and elsewhere. Yet far more exciting was the controversy over the suppression of the missionary meetings and expulsion of the English Salvationists, a question which agitated Switzerland for many months. (See SALVATION ARMY.)

T

TARIFF. See page 129 *et seq.*

TENNESSEE. State Government.—The following were the State officers during the year: Governor, William B. Bate, Democrat; Secretary of State, D. A. Nunn; Treasurer and Insurance Commissioner, Atha Thomas; Comptroller, P. P. Pickard; Attorney-General, B. J. Lea; Superintendent of Public Instruction, J. H. Paine; Commissioner of Agriculture, Statistics, and Mines, A. T. McWhirter; Register of Lands, W. S. Winbourn; Railroad Commissioners, J. H. Savage, G. W. Gondon, and J. A. Turley. Judiciary, Supreme Court: Chief Justice, J. W. Deaderick; Associates, W. F.

Cooper, T. J. Freeman, Robert McFarland, and Peter Turney.

Legislative Session.—The Legislature convened on January 1st, and adjourned on March 30th. Among the acts passed were the following:

To exempt from execution tobacco to the amount of 800 pounds, in the hands of the actual producers; to prevent the sale, loan, or gift of pistol-cartridges; to prohibit the sale of toy-pistols; to provide for a more efficient management of public schools, and taxing districts where there is an incorporated system of public schools; to protect employes and day-laborers of corporations and partnership firms against the insolvency of such corporations and firms; providing an improved system for the assessment and collection of taxes; to

provide for the infliction of the death-penalty in private; to prevent the owners of billiard, bagatelle, or pool tables permitting minors to play thereon; to regulate pool-selling, book-making, and combinations upon turf, trotting, and pacing races; to punish criminal abortions; to provide for the erection of an insane hospital in the eastern division of Tennessee; to empower municipal corporations and taxing districts to compromise and fund their indebtedness; to provide for the lease and management of the State Penitentiary; to define the measure of damages recoverable in case of the death of a person caused by the wrongful act, fault, or omission of another; to provide for the regulation of railroad companies and persons operating railroads; to prevent discrimination upon railroads, to provide for the punishment of the same, and to appoint a railroad commission; to protect contractors and laborers for work performed and materials furnished for railroads; to provide for the redemption of the notes of the Bank of Tennessee, and to protect the State therein.

Debt Question.—The act of 1882 providing for compromising and funding the bonded indebtedness of the State was repealed, and a new act was passed, based in its terms upon the Democratic platform of 1882. The most important portions of this law, which its friends hope will prove a final settlement of the much-vexed debt question, are the following:

Such part of the State debt proper as now bears interest at the rate of six per cent. per annum shall be funded by adding to the sum of the face of the existing bond the matured interest thereon, evidenced by the coupons thereto attached, including the coupons maturing the 1st day of July, 1883, and from the total sum of the face of the bonds and matured interest thereon, evidenced by the coupons attached, twenty-four per cent. will be deducted and the remainder funded in coupon bonds, bearing interest at the rate of six per cent. per annum. Such part of the State debt proper as now bears interest at the rate of five and one fourth per cent. per annum shall be funded by adding to the sum of the face of the existing bonds the matured interest thereon, including the coupons maturing the first day of July, 1883, evidenced by the coupons thereto attached; and, from the total sum of the face of the bonds and the accrued interest, twenty-one per cent. will be deducted and the remainder funded with coupon bonds bearing interest at the rate of five and one fourth per cent. per annum. Such part of said State debt proper as now bears interest at the rate of five per cent. per annum shall be funded by adding to the sum of the face of the existing bond the matured interest thereon, including the coupons matured first day of July, 1883, evidenced by the coupons thereto attached, and from the total sum of the face of the bond and the accrued interest twenty per cent. will be deducted, and the remainder funded into coupon bonds bearing interest at the rate of five per cent. per annum:

Provided, however, That none of the bonds or parts of bonds heretofore issued under the previous funding acts for matured coupons shall be funded under this section as State debt proper bonds, but the same shall be funded at fifty cents on the dollar.

Be it further enacted, That such part of the before-mentioned public debt of the State as may have been funded under the act of 1882, shall be funded under this act upon the following basis: To the sum of the face of each of said bonds shall be added the coupons, now matured, thereto attached, including the coupons maturing the 1st day of July, 1883, and five sixths of such total amount of said bonds to be funded into coupon bonds, and said bonds to bear interest at the rate of three per cent. per annum, except such State debt proper bonds as are designated in section one of this act, and funded under the act of 1882, which shall be funded by adding to the face of each of said bonds the matured coupons thereto attached, including the

coupons maturing the 1st day of July, 1883, to which shall be added 26½ per cent. on bonds which bore 6 per cent. when originally issued and funded into new coupon bonds bearing interest at the rate of 6 per cent. per annum, and to such part of said State debt proper bonds as bore interest at the rate of 5½ per cent. when originally issued shall be added 31½ per cent., and they shall be funded into new coupon bonds bearing interest at the rate of 5½ per cent. per annum, and to such part of said State debt proper bonds as bore interest at the rate of 5 per cent. when originally issued shall be added 33½ per cent., and they shall be funded into new coupon bonds bearing interest at the rate of 5 per cent. per annum.

Education.—The scholastic population of the year was 418,822 white and 142,624 colored; number of schools, 4,727 white, 1,884 colored; total 6,111, sixty-nine of which were under the control of city boards. White pupils enrolled, 261,297; colored, 65,984; total, 327,281; average daily attendance, white, 144,306; colored, 31,498—total, 175,804. Number of white male teachers employed, 8,762; female, 1,518; colored male, 1,081; colored female, 422—total, 6,783. The receipts of the year were \$1,206,392. Expenditures (of which \$795,483 was for teachers, and \$57,804 for school-sites), \$918,863; balance, \$287,529.

The present school law, which was passed March 6, 1873, created a school fund, of \$2,512,500, with interest at 6 per cent. per annum.

Finance.—The cash received by the Treasurer from Dec. 19, 1880, to Dec. 19, 1882, was \$1,870,224.02, which, with \$222,424.89 cash in the treasury, made a total cash account of \$2,092,648.41. The disbursements from Dec. 19, 1880, to Dec. 19, 1882, were only \$1,584,638.83, which left in the treasury a cash balance of \$508,015.08. The total amount due by delinquents, Dec. 18, 1880, was \$375,804.70; Dec. 18, 1882, \$345,626.56, being a reduction of \$30,178.14 in the two years. The total State tax for 1882 on taxable property assessed at 20 cents on the dollar was \$443,849.42; in 1881, at 30 cents, it was \$675,869.58, making a deficit in tax of \$232,010.16.

The valuation of property in 1882 was as follows:

Value of land in acres.....	\$146,657,838
Value of town lots.....	48,725,735
Value of other taxables.....	26,546,245

Total value of taxable property in the State. \$221,929,818

Early in January the State Treasurer, M. T. Polk, fled from the State, and upon investigation it was found that he was a defaulter to the amount of \$374,864.50.

Railroads.—The total length of railroads in the State is 2,035 miles; and their total taxable value, \$31,197,200.

Congressional Districts.—The following are the congressional districts formed under a law of 1882, as amended in 1883:

1. Johnson, Carter, Sullivan, Washington, Unicoi, Hawkins, Greene, Hamblen, Hancock, Claiborne, Cocke, and Grainger counties.
2. Jefferson, Union, Sevier, Blount, Knox, Loudon, Roane, Anderson, Morgan, Campbell, and Scott.
3. Monroe, Polk, Bradley, Hamilton, Meigs, Rhea, Cumberland, James, McMinn, Bledsoe, Sequatchie, Marion, Grundy, Van Buren, White, and Warren.

4. Sumner, Wilson, Macon, Trousdale, Smith, De Kalb, Clay, Jackson, Putnam, Overton, Fentress, and Pickett.

5. Cannon, Coffee, Franklin, Lincoln, Moore, Marshall, Bedford, and Rutherford.

6. Davidson, Robertson, Cheatham, Montgomery, Stewart, Humphreys, and Houston.

7. Williamson, Maury, Giles, Lawrence, Wayne, Lewis, Hickman, and Dickson.

8. Henry, Benton, Perry, Decatur, Hardin, McNairy, Henderson, Madison, and Carroll.

9. Weakley, Gibson, Crockett, Haywood, Lauderdale, Dyer, Obion, and Lake.

10. Hardeman, Fayette, Shelby, and Tipton.

TENNEY, William Jewett, an American journalist, born in Newport, R. I., in 1814; died in Newark, N. J., Sept. 20, 1883. His father was the Rev. Dr. C. J. Tenney, pastor of the orthodox church in Newport, and his mother was Ruth Channing. Mr. Tenney was graduated at Yale College in 1832, and studied

WILLIAM JEWETT TENNEY.

medicine in Boston, but turned his attention to law, which he studied in New Haven, Conn. After being admitted to the bar, Mr. Tenney opened an office in New York city; but soon after joined the editorial staff of the "Evening Post," in which connection he continued for two years. He completed Benton's "Abridgment of the Debates of Congress" (left unfinished at Senator Benton's death); edited the "Queens of England" (1852); was editor of "The Mining Magazine," monthly (1853); and was a contributor to Hunt's "Merchants' Magazine." He was also occupied with various other literary works,

among which may be named "The Military and Naval History of the Rebellion in the United States" (New York, 1865). He was presiding judge of one of the criminal courts of Brooklyn, N. Y., for two terms, and during Mr. Buchanan's administration he was collector of the port at Elizabeth, N. J.

Thirty years ago Judge Tenney accepted a place in the establishment of D. Appleton & Co., New York. The "Annual Cyclopædia," issued by this house (of which the present volume is the twenty-third in consecutive order), was begun by him, and by him edited year by year, from its inception to his decease. He also did a large amount of other literary and critical work.

Judge Tenney was from time to time elected a freeholder, and was a member of the City Council of Elizabeth, N. J., for fourteen years.

He prepared the plan for organizing the public-school system, and was president of the board. Important decisions also were constantly referred to him.

He was twice married. His second wife was a daughter of Orestes A. Brownson.

Judge Tenney was known to his friends as a man of great purity and excellence, as well as possessed of clear intellectual power. He left two sons and three daughters.

TEXAS. State Government.—The State officers during the year were the following: Governor, John Ireland, Democrat; Lieutenant-Governor, Marion Martin; Secretary of State, J. W. Baines; Treasurer, Frank R. Lubbock; Comptroller, W. J. Swain; Attorney-General, J. D. Templeton; Commissioner of Lands, W. O. Walsh; Commissioner of Insurance, H. P. Brewster; State Engineer, J. H. Britton. Judiciary, Supreme Court: Chief-Justice, Asa H. Willie; Associate Justices, John W. Stayton and Charles S. West.

Legislative Session.—The Legislature convened on January 9th, and adjourned on April 13th. On January 23d, Richard Coke, Democrat, was re-elected United States Sen-

ator without substantial opposition. Of the 700 bills introduced, about 150 became laws. In reviewing the work of the session, the Governor said:

By the act to protect the wool-growing industry of western Texas, a great enterprise is aided and encouraged. By the act organizing the judicial districts, the disposition of business in the courts will be greatly facilitated. The act to facilitate the collections of claims from the General Government on account of moneys expended in frontier defense, will enable Texas to reclaim money she should have had long since. The railroad bill is a measure designed on the one hand to satisfy a reasonable demand for a system of supervision sufficiently extensive and minute as regards the safe condition of road-beds and bridges,

and as regards fair dealing with shippers; and designed on the other hand to avoid the over-regulation that might work serious injury alike to the public and to legitimate railroad business. The law regulating the management of the penitentiaries was amended so as to forbid the leasing of the same, but authorizes the board to hire convicts to planters for a term of years if in their judgment the interests of the State will be served. The food-adulteration act provides that no person shall manufacture, offer for sale, or sell any article of food, wines, beers, fermented or distilled liquors or drugs, which is by him known to be adulterated, within the meaning of this act.

Four amendments to the Constitution were passed, and directed to be submitted to a vote of the people on the second Tuesday of August. These amendments follow: The first provides for the sale of lands set apart for schools. The second limits the amount of taxation by the State to 85 cents on \$100, exclusive of taxes to pay the public debt and for free schools; and by counties and towns to 25 cents on \$100, except for debts incurred before the amendment, or for permanent improvements. The third relates to taxes for a free-school fund. The fourth regulates the terms of the county courts. These were ratified by the following vote:

AMENDMENTS.	For.	Against.
First	92,784	91,060
Second	92,439	90,188
Third	80,558	90,287
Fourth	80,640	17,498

Congressional Districts.—The new congressional districts formed in 1882 are as follow:

- Harris, Chambers, Liberty, Jefferson, Orange, Hardin, Waller, Montgomery, Grimes, Walker, Polk, Tyler, Jasper, Newton, San Jacinto, Brazos, Madison, Trinity, and Angelina counties.
- Robertson, Leon, Houston, San Augustine, Sabine, Freestone, Anderson, Cherokee, Nacogdoches, and Henderson.
- Panola, Harrison, Rusk, Gregg, Smith, Wood, Van Zandt, Upshur, Camp, Hunt, Shelby, and Rains.
- Cass, Marion, Bowie, Red River, Morris, Titus, Franklin, Lamar, Delta, Fannin, and Hopkins.
- Grayson, Collin, Cooke, Denton, Wise, Montague, Clay, Rockwall, Wichita, Wilbarger, Archer, and Baylor.
- Ellis, Kaufman, Dallas, Tarrant, Hill, Johnson, and Bosque.
- Galveston, Brazoria, Fort Bend, Wharton, Matagorda, Jackson, Calhoun, Victoria, Goliad, Refugio, Bee, San Patricio, Nueces, Duval, Cameron, Hidalgo, Starr, Zapata, Encinal, Webb, McMullen, La Salle, Dimmit, Aransas, Maverick, Zavalla, De Witt, and Frio.
- Austin, Lee, Fayette, Colorado, Lavaca, Gonzales, Caldwell, Hays, Guadalupe, Wilson, Karnes, Live Oak, and Atascosa.
- Washington, Burleson, Milam, Bell, Falls, McLennan, Limestone, and Navarro.
- Travis, Comal, Blanco, Bexar, Medina, Bandera, Uvalde, Kinney, Edwards, Kerr, Kendall, Gillespie, Kimble, Burnet, Llano, Mason, Menard, Lampasas, McCulloch, Concho, Coleman, Runnels, Bastrop, Williamson, Crockett, and San Saba.
- Parker, Hood, Somerville, Coryell, Hamilton, Brown, Comanche, Erath, Eastland, Palo Pinto, Stephens, Jack, Young, Throckmorton, Shackelford, Callahan, Taylor, Jones, Haskell, Knox, Nolan, Mitchell, Howard, Martin, Andrews, Gaines, Dawson, Borden, Scurry, Fisher, Stonewall, Kent, Garza, Lynn, Terry, Yoakum, Cochran, Hockley, Lubbock, Crosby, Dick-

ens, King, Cottle, Motley, Floyd, Hale, Lamb, Bailey, Tom Green, Pecos, Presidio, Childress, Swisher, Deaf Smith, Donley, Gray, Oldham, Hutchinson, Lipscomb, Sherman, Hall, Castro, Randall, Collingsworth, Carson, Hartley, Roberts, Ochiltree, Dallam, Greer, Briscoe, Farmer, Armstrong, Wheeler, Potter, Moore, Hemphill, Hardeman, Hansford, and El Paso.

Finance.—The reduction of the State debt in the past four years has been \$1,745,157.21. Of the bonds now outstanding, \$1,712,200 bear 6 per cent., \$1,254,000 are 7 per cents, \$1,068,900 are 5 per cents, and \$2,680 are 4 per cents. The school fund, university fund, and other State special funds hold \$2,547,100 of these bonds, and Texas counties hold nearly half a million more, leaving only about \$1,000,000 held by private parties. The following table shows the appropriations made by the 18th Legislature, used and to be used during the two years from March 1, 1883, to March 1, 1885, with corresponding appropriations by the 17th Legislature for the years beginning March 1, 1881, and ending March 1, 1883;

APPROPRIATIONS.	17th Legislature, two years.	18th Legislature, two years.
Executive Department.....	\$58,820	\$50,600
Department of State.....	84,170	89,570
Treasury Department.....	27,400	41,200
Comptroller's Department.....	96,400	119,700
General Land-Office.....	115,350	167,540
Insurance Bureau.....	19,400	38,000
Fish Commission.....	6,600	10,400
Adjutant-General's Office.....	148,400	161,700
Attorney-General's Office.....	22,570	28,390
Deaf and Dumb Asylum.....	55,850	180,873
Lunatic Asylum.....	378,440	526,960
Blind Asylum.....	88,835	71,820
Pensions.....	2,800	92,800
Board of Education.....	4,000	4,000
Sam Houston Institute.....	40,000	41,000
Prairie View Institute.....	21,787	25,600
Summer normal schools.....	3,000	12,000
Agricultural and Mechanical College.....	15,000	40,000
Survey University and school lands.....	4,500	5,000
Quarantine.....	76,000	106,000
Penitentiaries.....	418,500	210,500
Interest on public debt.....	698,456	698,124
Sinking fund.....	200,000	161,506
To pay university bonds.....	242,050
To pay school bonds.....	552,074
Capitol Commission.....	82,000	21,750
Miscellaneous.....	90,029	117,581
Judiciary.....	755,801	779,975
Deficiencies.....	468,317	82,669
State Cemetery.....	3,500
Legislature, mileage, etc.....	140,000	120,000
To retire bonds.....	1,120,091
State sewer.....	45,000
Temporary Capitol.....	50,000
Total.....	\$5,107,775	\$4,561,683

These amounts do not include the available school fund derived from taxation, either for the last term or the ensuing two years. The valuation for 1884 is estimated at \$527,500,000.

Education.—Texas has more liberally endowed all the State educational institutions than any other State in the Union. This endowment amounts to nearly \$100,000,000. To this may be added buildings at the Agricultural and Mechanical College, some \$200,000, and college lands, \$12,000; buildings and lands at Prairie View Normal School (for colored teachers),

\$15,000; buildings, etc., at Sam Houston Normal School, \$10,000; university grounds and buildings, \$100,000, and school-houses in many of the counties belonging to the State. The scholastic census shows a population of about 310,500, to which is to be distributed about \$1,375,000, or about \$4.41 per capita, which will probably support a term of 5½ months. The change in the Constitution separates the school-tax from that for general purposes, and will permit an increased school revenue.

The State University was opened in the autumn. The State, by the last Constitution, gave a million acres of land to the institution, which was located in the pastoral regions of southwest Texas, and which will probably be leased and produce a handsome income. Also, at the last session of the Legislature, a further donation of a million acres of land was made, which is in Northwest Texas. The university permanent fund now comprises about \$539,198.40 in bonds and 2,000,000 acres in lands.

The Agricultural and Mechanical College, endowed by act of Congress, has a permanent fund in State bonds of \$209,000, and enjoys annual appropriations from the State treasury, supporting 93 State students. At the last session of the Legislature the sum of \$40,000 was appropriated to equip the agricultural and mechanical departments.

The two permanent normal schools, one at Huntsville for white, and the other at Prairie View for colored students, are liberally supported. Not only are the students provided free tuition, but their board and lodging are paid for out of the State treasury. The State also, during one or two months in the summer, supports thirty-one normal schools for whites, and eleven for colored teachers. The average attendance is about 25 each, or about 1,000 teachers preparing for the public schools.

The Penitentiaries.—During the year the Legislature made a change from the system of leasing the penitentiaries and convicts so long in vogue. Under the new system contracts are made for working 1,500 of the 2,800 State convicts in the walls of the two penitentiaries.

Railroads.—The following figures relate to the close of 1883:

Total miles of railroad (including side-tracks).....	6,465.24
Total miles of wood bridges.....	154.07
Total miles of combination bridges.....	2.50
Total miles of iron and steel bridges.....	5.50
Total number of locomotives.....	601
Total number of passenger-cars.....	269
Total number of baggage, express, and mail cars.....	111
Total number of freight-cars.....	13,243
Total miles of steel rails.....	2,243.20
Total miles of iron rails.....	4,222.04

There is little prospect of railway construction being resumed to any very great extent during 1884.

Crops and Shipments.—The following is an exhibit of the amount and value of State products—principally exports—for the year ending Aug. 31, 1883:

	Value.
Cotton, 1,518,810 bales.....	\$75,665,508
Wool, 22,750,230 pounds.....	4,100,441
Hides, 13,812,746 pounds.....	1,464,403
Cattle, 703,642 head (including the drive).....	10,346,350
Horses, 19,224 head.....	\$450,000
Lumber and shingles.....	2,226,412
Grain and hay.....	5,674,515
Cotton-seed, cotton-seed cake and oil.....	3,423,516
Miscellaneous products.....	2,576,419
Sugar and molasses.....	642,210
Total.....	\$119,906,296

THEOLOGICAL SCHOOLS OF THE UNITED STATES. The early New England colonists brought from the Old World their Puritan doctrines and customs. Many of the first preachers had received their training in the English universities. When the earliest colleges were founded, the prime object contemplated was the fitting of young men to preach the gospel, which accounts for the fact that the colleges on this continent are mostly denominational. No professors of divinity were appointed, nor were theological topics introduced into the courses of study; but the presidents of the colleges were expected to be able to give timely and special counsel to young men who might contemplate devoting themselves to the work of the ministry. Dr. Dwight, at Yale College, taught theology in his Sunday sermons, which were so arranged as to form a body of divinity. Rev. Charles Backus (born 1749, died 1803), while a pastor in Connecticut, educated nearly fifty theological students. The first actual experiment in public theological instruction was begun by the Rev. Dr. John M. Mason, of New York. Dr. Mason was graduated at Columbia College in 1789, went to Edinburgh to study theology, and in 1793 assumed the pastorate of the Reformed Church in New York city. He gathered ministerial candidates about him, and for some years gave them regular instruction in Greek and Hebrew exegesis, and kindred topics. At length he projected the plan of a theological seminary, which (the first on this continent) was established in New York in 1804, Dr. Mason being its professor of theology. In 1808 the Congregationalists organized a theological seminary at Andover, Mass., which was the first in the United States having a fully equipped faculty. In 1812 the Presbyterians founded a theological seminary at Princeton, N. J. In 1817 the Protestant Episcopal Church founded the General Theological Seminary in New York. Since the above dates such institutions have multiplied rapidly, and now all the larger denominations have well-organized theological schools.

The regular course of study in all the fully organized theological schools extends over a period of three years. A few of the seminaries have recently added a fourth year, for post-graduate study. The curriculum is designed for college graduates, but others are admitted if their previous studies enable them to pursue it profitably. Young men who have not enjoyed the benefits of liberal culture are

permitted to take a partial course, omitting the advanced studies, and more difficult and critical questions. Among the topics embraced in the regular course are the following: 1. Biblical interpretation, including study of the Hebrew language, exegesis of parts of the Greek Testament, and history of manuscripts. 2. Theology, including a systematic examination of the proofs of the existence of God, origin and inspiration of the Scriptures, and Jesus Christ, his deity, his humanity, his theanthropic personality, the atonement, etc. 3. Ecclesiastical history, including study of the ancient, mediæval, and modern Church, schisms, history and development of doctrines, the Reformation, Reformed Churches, etc. In addition to class recitations from textbooks, the student is expected to do much collateral reading, and to prepare essays upon the subjects gone over. The professors of the department also give instruction by lectures. 4. Homiletics, or a study of the best methods of preparing and delivering sermons. 5. Practical duties of the pastor. 6. Elocution. In addition to instruction in breathing and voice-culture, particular attention is given to the reading of Scripture and hymns, and to lectures on pulpit oratory. 7. Lectureships. During the past few years provision has been made in nearly all of the larger institutions for a course of lectures each year, by men who have been successful as ministers and of acknowledged eminence in scholarship, on subjects relating to preaching, and to the practical work of the pastor.

The following is a statistical summary, from the latest reports available, January 1, 1884, of the theological schools in the United States:

DENOMINATION.	Seminaries.	Professors.	Students.
Baptist.....	19	67	968
Congregationalist.....	11	58	837
Christian.....	6	11	162

Universalist.....	2	8	31
Others.....	6	19	78
Totals.....	148	565	4,784

TIME, STANDARD AND COSMOPOLITAN. The subject of fixing upon a uniform standard of time, with which the local time of all places may be compared, has been discussed for many years. The confusion which may arise from the existence of so many varying standards of time as now prevail at different meridians has long been recognized by sailors, who, when they have reached a point half-way around the earth from the one whence they started, are accustomed to add a day to their reckoning, or to subtract one, according as they have sailed east or west. The same difficulties exist, but lessened in a degree, in all the continents and in all single countries of considerable extent. They have not, however, forced themselves upon the attention of the general public as matters demanding practical treatment until since the general extension of the railroad systems and telegraph lines. They have been felt with peculiar force in the United States, because of the great longitudinal extent of the country, which causes a difference of four hours in time between the Atlantic and the Pacific States, and of the intricacies of the railroad connections. Previous to the adoption of the uniform standards, in November, 1883, the managers of the several railroads in the United States endeavored to conform to the local time of the most important or most central stations on their respective lines. Sometimes they used one standard to control the running of the trains on one part of their line, and another standard on another part. Sometimes they had to arrange for time-connections with other railroads running by standards differing from their own and from one another. It was computed that there were about 75 different standards controlling the moving of the trains in different parts of the country. A traveler going from Boston to Washington would have to set his watch five times in order to keep correct time while on the journey. From Boston to Providence he would be traveling on Boston time; from Providence to New London on Providence time; from New London to New York on New York time; from New York to Baltimore on Philadelphia time; and from Baltimore to Washington on Washington time, which is 24

minutes slower than Boston time. Sometimes three or four standards of time competed with each other in the same city, as in Hartford, Conn., where some of the trains left on Boston time and others on New York time, while the local time was used in the city at large. The same embarrassment had already been felt, though on a much smaller scale, in England; and, to remedy it, on Jan. 13, 1848, all the clocks in the kingdom were set to conform to Greenwich time; and they have been regulated by that standard ever since.

The question of introducing a uniform system in the United States was discussed for several years before a practicable plan was found. It was agreed that the adoption of a single standard for the whole United States would be impracticable, because it would introduce too many and too great discrepancies between the time by the clock and the solar time, and would be repugnant to the habits and convenience of the people. Four standards were accordingly proposed, so adjusted as to be one hour apart, and to differ by exact hours from the time at Greenwich; the effect of which would be, that the only difference should be in the numbering of the hours, while the numbering of the minutes and seconds should be the same at all places using the standards as well as at all places using Greenwich time. The details of a plan embracing these principles were worked up by Mr. W. F. Allen, Secretary of the General and Southern Railway Time Conventions; and at the meetings of the time conventions, held in New York and Chicago in April, 1883, the following resolutions were adopted:

1. That all roads now using Boston, New York, Philadelphia, Baltimore, Toronto, Hamilton, or Washington time as standard, based upon meridians east of those points, or adjacent thereto, shall be governed by the 75th meridian or Eastern time (four minutes slower than New York time).
2. That all roads now using Columbus, Savannah, Atlanta, Cincinnati, Louisville, Indianapolis, Chicago, Jefferson City, St. Paul, or Kansas City time, or standards based upon meridians adjacent thereto, shall be run by the 90th meridian time, to be called Central time, one hour slower than Eastern time and nine minutes slower than Chicago time.
3. That west of the above-named section the roads shall be run by the 105th and the 120th meridian times, respectively, two and three hours slower than Eastern time.
4. That all changes from one hour standard to another shall be made at the termini of roads or at the ends of divisions.

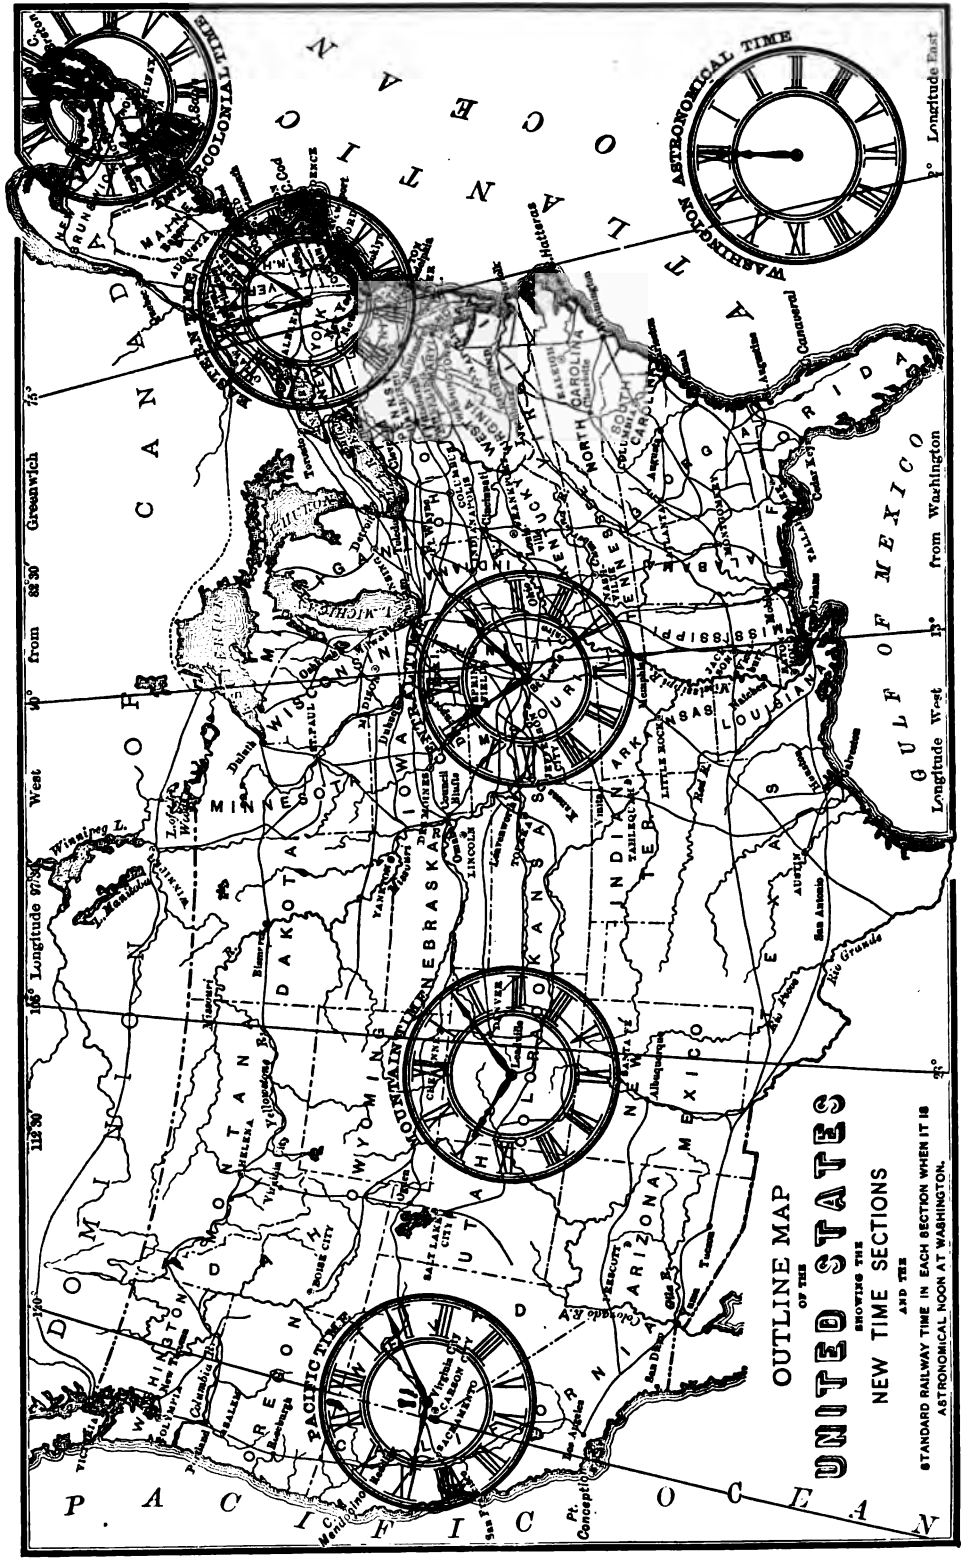

This scheme was received favorably by most of the railroads whose time would be regulated by that of the Eastern and Central meridians, and was put in operation by the principal railroads of the New England States on October 7th, and, with few exceptions, by those of the other States east of the Rocky mountain region on November 18th. The local time at most of the towns and cities was also made to conform to the new standards, the greatest alteration in clocks required to do so being about half an hour. The following table gives a gen-

eral view of the relations in round minutes of the standard meridians to Greenwich and to the true local times of the places adopting them:

SECTION.	West of Greenwich.	Standard time, compared with true local times. + = Faster than. - = slower than.	Designation of standard time.

The belt of country situated $7\frac{1}{2}^{\circ}$ on either side of a standard meridian generally (with such exceptions as the peculiar relations of certain places may make it expedient to recognize) is expected to adopt the time of that meridian.

Related to the subject of Standard time for the United States is that of Cosmopolitan time, or the selection of a uniform meridian and standard of time for the whole world. A scheme for an international system of time-reckoning, embodying this principle, was proposed independently by the Hon. Sanford Fleming, Chancellor of Queen's University, Toronto, and Prof. Cleveland Abbe, of the United States Signal Service, and was presented by President Barnard, of Columbia College, to the International Association for the Reform and Codification of the Law of Nations, at its meeting in Cologne, in August, 1881. It recommended that 24 standard meridians be fixed upon, distant from each other 15° or one hour each in longitude, to which only the arbitrary local times kept at all places on the earth's surface shall be referred; that the prime meridian, by reference to which all the other hour meridians shall be determined, be that of 180° or twelve hours from the meridian of Greenwich; a meridian which passes near Behring strait and lies almost wholly on the ocean; that the diurnal change of count in the monthly calendar begin when it is midnight on this prime meridian, and take place for the several meridians successively; that the hour of the day at each place be reckoned by the standard meridian nearest to it in longitude, it being reckoned as twelve o'clock, noon, at the moment the mean

Longitude East

sun passes such standard meridian, while the minute and second shall be the same at all times and for all places; that the hours of the day be numbered from one to twenty-four; that for special purposes, as with a view to promote exactness in chronology and to facilitate synchronous observations in science, the day and the time of the day, as determined by the prime meridian, be employed as a kind of universal time-reckoning, under the name of "Cosmopolitan Time," its hours to be denoted by distinct symbols (as by the letters of the alphabet), to distinguish them from the hours of local time. The Government of the United States recommended the calling of an international conference, to perfect some scheme of uniformity. The subject was again considered at the seventh General Conference of the International Geodetic Association, which met in Rome, Oct. 16, 1888, the United States being represented by Gen. Cutts, of the Coast Survey. A full report was made upon it by Prof. Hirsch, of the Observatory of Neufchâtel, Switzerland, and the Conference resolved that:

The unification of longitudes and of hours is desirable as well in the interest of the sciences as in that of navigation, of commerce, and of international communication; the utility, scientifically and practically, of this reform far surpasses the sacrifices in labor and changes required of a minority of civilized countries. It ought, then, to be recommended to the governments of all countries interested, to be adopted and consecrated by an international convention.

Notwithstanding the great advantages which the general introduction of the decimal division of the quadrant for geographic and geodetic co-ordination, and the corresponding expressions for time, is destined to realize, scientifically and practically, reasons eminently sound appear to justify the passing by the consideration thereof in the great measure of unification proposed in the first resolution. Meanwhile, to satisfy at the same time important scientific considerations, the Conference recommends on this occasion the extension, in multiplying and perfecting the necessary tables, of the application of the decimal division of the quadrant, at least for the great numerical calculations for which it presents incontestable advantages, even if it be desired to preserve the sexagesimal division for observations, maps, navigation, etc.

This Conference proposes to the governments to choose as initial meridian that of Greenwich, defined by the middle of the pillars of the meridian instrument of the Observatory of Greenwich, because this meridian fulfills, as point of departure of longitudes, all the conditions required by science, and because, being already the most extensively used, it offers better prospects of being generally adopted. The longitude should be reckoned from the meridian of Greenwich, in the sole direction of from west to east.

This Conference recognizes the utility for certain wants of science, and for the service of important lines of communication, adopting a universal hour, to be used together with the local or national time, which will necessarily continue to be used in ordinary life.

This Conference recommends, as the point of departure of the universal hour and of cosmopolitan date, the mean noon of Greenwich, which coincides with the instant of midnight or with the beginning of the civil day, under the meridian situated at 12 hours or 180° from Greenwich, the universal hours to be counted from zero to 24.

It is desirable that those countries which, in order to adhere to the unification of longitudes and of hours, have to change their meridian, should introduce the new system of longitudes as early as possi-

ble in their official ephemerides and almanacs, in their geodetic, topographic, and hydrographic works, and into their new maps. It would be advisable, in new editions of old maps, to inscribe alongside the numbers of the old meridian what it would be according to the new system. Then the new system should be introduced without delay into the schools.

The Conference hopes that, if the whole world is agreed upon the unification of longitudes and hours in accepting the Greenwich meridian as the point of departure, Great Britain will find in this fact an additional motive to take on her side new steps in favor of the unification of weights and measures, by joining the Metrical Convention of May 20, 1875.

These resolutions will be made known to the governments and recommended to their favorable consideration, with an expression of the wish of this Conference that an international convention, consecrating the unification of longitudes and hours, may be concluded as early as possible by means of a special conference.

TONQUIN, the most populous province of the kingdom of Anam, with which it was incorporated in 1802. Anam is an absolute monarchy. The total area is about 440,500 square kilometres; the total population about 21,000,000, exclusive of the tributary states of the Laos and the independent Moi tribes. The residence of the King is Hué, which has 50,000 inhabitants. Tonquin has a population of 15,000,000. The capital is Hanoi, containing 150,000 inhabitants, of whom 3,000 are Chinese. The mass of the people worship tutelary gods. The majority of the educated class follow the doctrines of Confucius. The Christian religion is professed by about 420,000 persons, under six Catholic bishops. The Anamese army musters about 150,000 men. The total commerce of the port of Haiphong in 1881 amounted to 2,171,428 taels. The principal exports are silk, lac, tin, medicinal drugs, cotton, mushrooms, and anise-seed oil. The trade is chiefly in the hands of the Chinese. The French possessions in Farther India consist of the six provinces of Lower Cochin-China, ceded to France in 1862 and 1867, and containing 1,597,018 inhabitants in 1880.

Historical Review.—The political and military power of France in Farther India dates from before the Revolution. A French force landed in 1769, by the aid of which, after a ten years' war, Nguyen Anh, or Giacong, established himself upon the throne. This Emperor did not acknowledge the suzerainty of China, of which four centuries before Anam, with Cochin-China and Tonquin, had formed an integral part. His son and successor paid homage to the Emperor of China in order to escape through his protection the tutelage of the missionary priests, who were the officious vehicles of French domination. In 1825 he refused to receive a French embassy. Tonquin, which was incorporated in the new empire of Anam, but chafed under the foreign rule, welcomed the missionaries because they were obnoxious to the Emperor. This was the occasion of a long and cruel persecution of the missionaries by the Anamite authorities. The horrors only ceased upon the death of the tyrant in 1841. His successor, Thieutri, was disposed to repeat

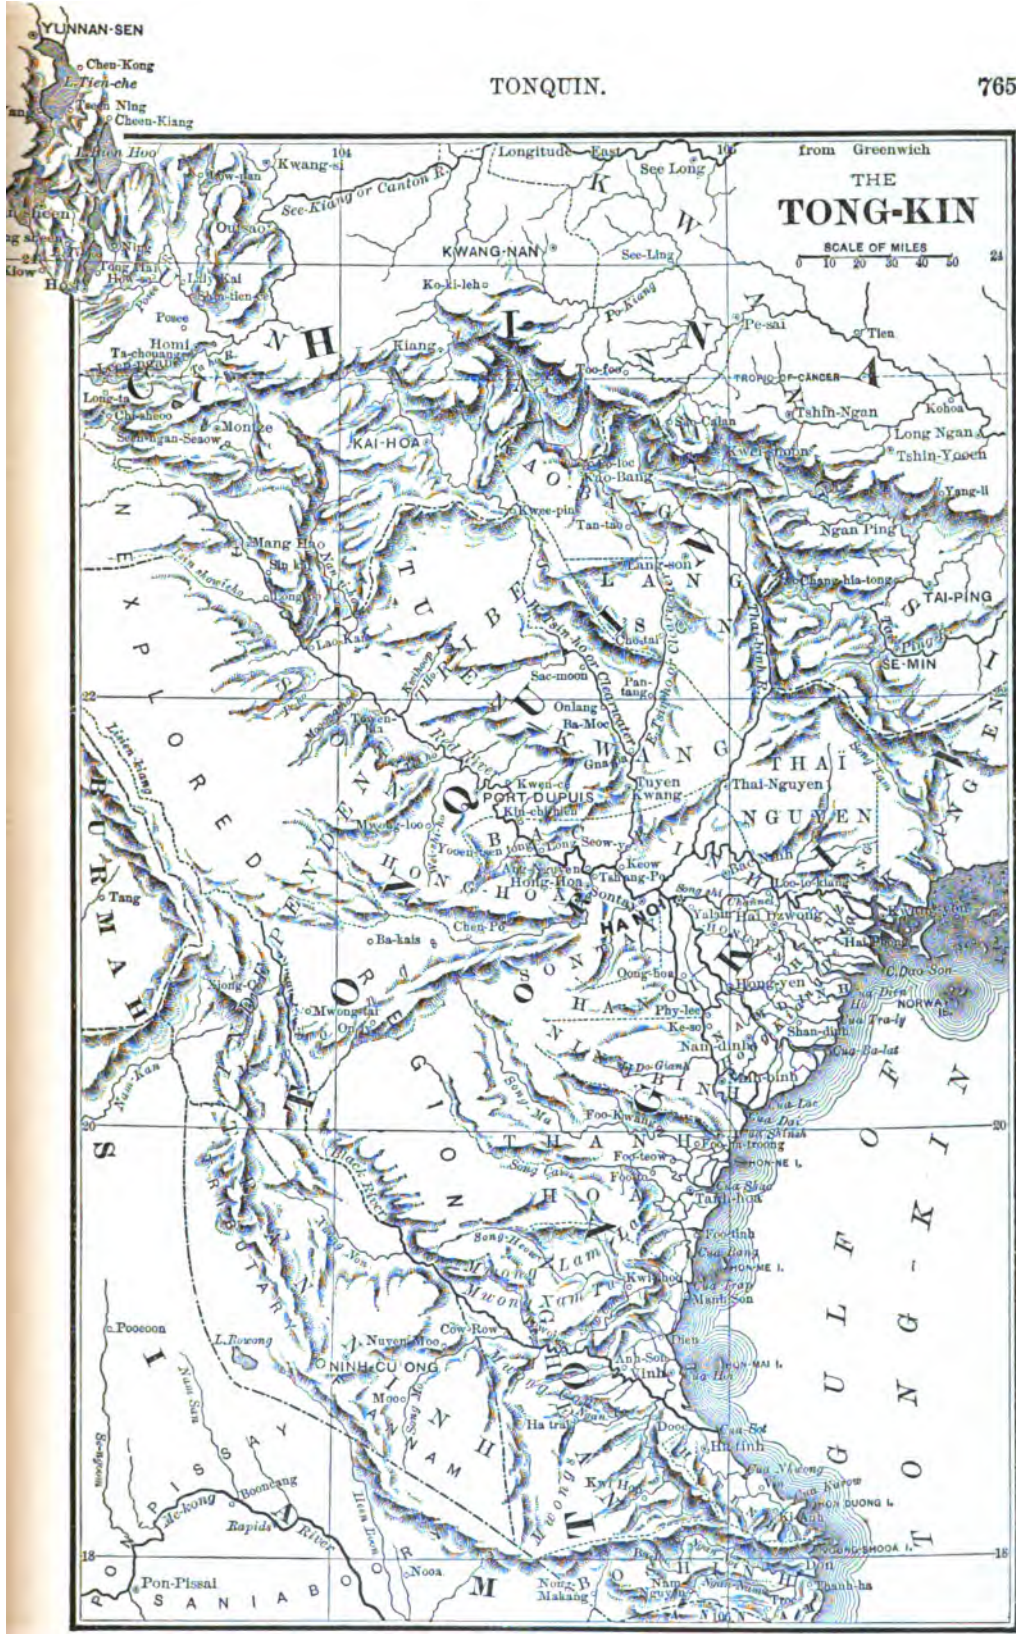

the crimes of his father, but took warning from the successes of English arms in the opium war. In 1847 Commodore Lapierre arrived in Turon with two war-vessels, to demand the religious freedom from the Anamite monarch which the Emperor of China had recently granted by treaty. The French commander was warned during the negotiations of an intended massacre, and prepared for combat. Anamite armed craft collected in the harbor, and, when they did not depart upon Lapierre's warning, he opened fire and annihilated the whole fleet. A few months later Thientri's son succeeded him, under the name of Tuduc. On the pretext that the Christian priests intrigued with one of the imperial princes, he ordered his officers to throw into the water every missionary who fell into their hands. In 1851 and 1852 many were executed. After the termination of the Crimean War, another French vessel of war brought a written message, which the Emperor refused to receive. The commander thereupon bombarded the port and landed troops. Yet after long procrastination the French force sailed away without obtaining any definite terms. This emboldened Tuduc to persist in his persecutions. One of the missionaries, Bishop Pellerin, at last moved Napoleon III to dispatch another expedition, which, under the command of Admiral Rigault de Genouilly, arrived at Turon in August, 1858. The French took the town by assault, and proceeded to fortify it, but by the unwholesome climate the force was soon so reduced that it could not hold the place. The troops therefore re-embarked, and in the beginning of 1859 took Saigon, in Cambodia, by storm. Admiral Rigault de Genouilly was replaced by Admiral Page. While the latter was planning operations against Turon and Hué, the former commander convinced Napoleon of the importance of Saigon and its district. The consequence was, that in the following years the French continued the conquest of Cambodia, fortified and garrisoned Saigon, and repelled the Anamites several times. On June 5, 1862, Tuduc was obliged to sign a treaty which reduced his sovereign rights, and accepted French protection. He would not have submitted to such terms if the Tonquinese had not broken out in rebellion at that time. The leader of the rebel army was Pedro Phuong, a descendant of an ancient dynastic family and a zealous Catholic. The French availed themselves of the difficulties between Anam and Tonquin to encroach upon the powers of Tuduc until, in 1874, after the campaign of 1878, in which François Garnier lost his life, they extorted from him a treaty which reduced him to vassalage. It admitted the French to three ports of Anam, with the right of maintaining a garrison, required the King of Anam to conform his foreign policy to the wishes of France, and promised him assistance in preserving order, suppressing piracy, and defending his land against foreign attacks.

Tuduc, instead of carrying out his part of the compact, embraced the ancient feudatory relation to China, which the Peking Government now hastened to reassert, in order to escape the French protectorate. The French Government made no attempt to enforce the treaty, but postponed the matter year after year, until the events in Egypt and the new impulses to external activity spurred them to action.

The absorption of Anam and Tonquin would open the gates of China under as favorable conditions as were enjoyed by English merchants in Hong-Kong and Canton. The Alpine province of Yunnan, inhabited by Chinese Mohammedans and aboriginal Mino-tsés, is bound by very loose political ties to the Celestial Empire. They held out many years against the Peking Government before their rebellion was suppressed in 1872. It was this rebellion which suggested to the Indian Government, to which the rebels appealed for assistance, the possibility of reopening the great commercial route of antiquity through Burmah to the mouth of the Irrawaddy. The British home authorities, reluctant to give any encouragement to the rebel King, Suleiman, recalled the expedition of Maj. Sladen. The second expedition, in 1874, was driven back by the Chinese, after the interpreter Margary had first been murdered. The route has only recently been explored by Mr. Colquhoun. The rebellion of Suleiman first put, likewise, the Red river route into the minds of the French, and was the occasion of the last war in Tonquin. The French merchant Dupuis was commissioned by the Governor of Yunnan to explore the Red river with reference to transporting materials of war into the disturbed province. The Tonquin authorities forbade the transport of arms and ammunition, Dupuis appealed to his government to punish the Tonquinese, and gallant young French officers were eager for the adventure. With an incredibly small force they stormed citadels, routed armies of the worthless Anamese troops, and occupied the whole country, meeting with no formidable resistance until they encountered the Black Flags.

The inaccessible regions in the interior of China were the objective point of the aggressive policy in Burmah of the late British Government. The Red river has every advantage over the overland commercial route from British Burmah. It is an uninterrupted water route; the distance from the ocean is much shorter; and it passes through a country capable of a high material development.

Controversy with China.—The treaty was concluded at Saigon, March 15, 1874, between France and Tuduc. The text was communicated to the Chinese Government on March 25, 1875. A protest was immediately (June 10th) returned by China, which declared that it refused to recognize the treaty. In 1880 the Marquis Tseng interrogated M. de Freycinet with reference to a rumored French expedition to Tonquin, and was assured that no

expedition was contemplated, but that France was considering the question of upholding the treaty of Saigon. Subsequently, upon the circulation of fresh rumors, the Chinese representative addressed a letter of inquiry to the succeeding Minister for Foreign Affairs, M. St. Hillaire, asking whether the intentions of the French Government had undergone any change with regard to the kingdom of Tonquin, "whose prince has hitherto received investiture as a vassal from the Emperor of China." The reply, of the date of Sept. 27, 1880, declared the intention of France to conform to the treaty of 1874, which "guaranteed the kingdom of Anam its entire independence of all the powers," and "placed all the European interests in Anam under the protection of France." The Marquis Tseng wrote, under the date of Sept. 24, 1881, that the Peking Government does not recognize the treaty of 1874, or the right of the Prince of Anam to change by his sole act China's "unquestionable rights of suzerainty." M. Gambetta, who succeeded in the ministry, sent the reply, Jan. 1, 1882. He described Anam as an "empire." "I can not," he wrote, "allow you to protest against the treaty of 1874. That treaty was duly notified, and in its reply of June 10, 1875, your Government made no protest. Anam was mentioned solely as formerly a tributary of China, which is merely of historical interest." On this plea the French minister refused to agree to a protest against a treaty "the time for carrying out which has arrived," but declared that "the Government of France cherishes no designs which can harm Chinese interests." The Marquis replied on Feb. 12, 1882, after M. Gambetta had given place in the Foreign Office to M. de Freycinet, correcting the allusion to the colony of Cochinchina, and denying the construction put upon the Chinese protest of June 10, 1875, to the treaty of Saigon. The terms used by Prince Kung in that reply, he asserted, far from referring to the tributary position of Anam as merely a question of historical interest, "signify that Anam has been, and still is, a country tributary to China, whose constant acts of submission still make it a vassal state. 'If Prince Kung did not discuss the articles of the treaty,' he explains, 'it was because he refuses to recognize it; for the Chinese Government protested against the treaty of 1874 as soon as it was submitted to it.'"

In April, 1882, when rumors of the capture of Hanoi reached the Chinese ambassador, he sought explanations from M. de Freycinet, who assured him that the affair was of no importance, and that what had been done was without the sanction of the French Government. This explanation was forwarded to the Peking Government, and on May 6, 1882, the Marquis Tseng informed the French minister that he had tranquillized the court at Peking. On the 31st of May he received from M. de Freycinet a dispatch correcting the interpre-

tation which had been put upon his words, couched in the following terms: "I confined myself to saying that the French Government had given orders for carrying out the treaty of 1874. I added that the consequences of the influence I intended to exercise concerned only the signatories of the treaty, and that consequently we had no explanation to give to the Chinese Government." In his reply, dated June 14, 1882, the Marquis Tseng protested against this position in the following language: "If a suzerainty of centuries over Tonquin, a contiguous frontier for thousands of *lis*, a numerous colony settled in the country, commercial interests whose extent yields to those of no other country, and the navigation of a river which is the outlet of the southwest of China—if, I say, all these titles put together, do not give the Imperial Government a right of being interested in what happens in Tonquin, I should be glad to know what could confer such a right." This remained unanswered, and for many months there was little intercourse with the European representative of China.

Meanwhile negotiations were opened at Peking, and in November, 1882, M. Bourée, the French minister, agreed upon a scheme of arrangement which, however, was rejected by the French Government. On May 16, 1883, M. Bourée was recalled to France, and M. Tricou, ambassador to Japan, was sent on a special mission to China, and entered into negotiations with the Viceroy, Li Hung Chang, who was proceeding to take command of the Chinese troops in the four southern provinces. On July 4th M. Tricou announced that any aid given by China to Anam would involve a *casus belli*. The Chinese Government disavowed any responsibility for the acts of Chinese subjects in Anam.

About this time the scene of negotiations was again transferred to Europe. On Aug. 18, 1883, the Marquis Tseng declared the bases on which China was willing to treat, which were the preservation of Chinese suzerainty and the evacuation of Tonquin by France, on the one hand, and the opening of the Red river to commerce on the other. M. Challe-mel-Lacour, in reply, August 27th, denied the suzerainty, and declared that the affairs of Tonquin must be settled with Anam alone. A new situation was now created by the French military successes, the change of rulers in Anam, and the treaty concluded at Huế, August 25th. The Chinese diplomats protested that there could be no king in Anam without investiture by the Emperor of China, and that the treaty therefore possessed no force or validity. Thence ensued a month's negotiations between the Marquis Tseng and MM. Jules Ferry and Challe-mel-Lacour, in which Lord Granville unofficially played the part of mediator. On September 15th propositions were submitted by the French Government, agreeing to the establishment of a neutral zone and providing for the opening of the town of Man

Hao, in Yunnan, to foreign commerce. The answer of the Chinese Government, October 15th, was to the effect that, if France was determined to disregard the suzerainty of China and the integrity of Anam, it would accept a neutral zone between the southern frontier of Tonquin and the 20th degree of latitude, and make Kuang Ho Khuang, opposite Sontay, a treaty port. By this arrangement China would acquire possession of the delta of the Songcoi and the control of the route to Yunnan, abandoning the other less valuable portions of the kingdom to be annexed to French Cochinchina. The Chinese Government offered to suppress piracy, subdue the Black Flags, and keep the Songcoi river open for commerce.

M. Jules Ferry, on Nov. 22, 1883, declared that France was inclined to respect the traditional bond between Anam and China, so far as it was not incompatible with the French protectorate. He announced that it was necessary to occupy certain new positions in Tonquin. In a communication, dated November 24th, the Marquis expressed regret that the French contemplated the occupation of Hanoi, Sontay, and Bacninh, which did not accord with the declarations of former ministers, who spoke only of a protectorate. M. Ferry replied, November 30th, that the object was to secure the protectorate, and added: "The plan of our military campaign in Tonquin has not been changed, and can not be changed. The responsibility for a conflict would rest upon China."

The Black Flags.—More formidable than the Anamese army were the irregular soldiers known as the Black and the Yellow Flags. These troops were not Anamese, but Chinese, and it is not known to what extent they were augmented by volunteers from the neighboring Chinese provinces. They are survivors of the valorous Taeping rebels who held the military power of the Chinese Empire at bay for many years. In 1865 the rebels, who had retired before the Chinese troops into the province of Kwangsi, were finally driven across the border into Tonquin, and found a secure retreat in the mountains on both sides of the Red river valley. This band of exiles, numbering about 5,000, were accompanied by their wives and families. Their chief was Watsong, one of Taeping Wang's principal lieutenants, and many of them continued the freebooting practices into which the rebellion degenerated in its latter period. They offered no further hostility to the Chinese Government, but rather became the supporters and instruments of Chinese policy and influence in Anam. The Anamese troops were sent against them several times, but were invariably defeated. In 1868 they held undisputed possession of the whole right bank of the Red river above the capital. With the assistance of the Chinese Viceroy of Canton, or Governor-General of the two Kwang, they were finally expelled from the low country and confined to the upper course of the river.

Soon after Watsong died, and his followers divided into two bands. The main body of the original Taeping rebels were disposed to settle down to peaceful pursuits, and to make their submission to the Chinese and Anamese authorities. They adopted the yellow flag for their ensign, and chose for their chief Hwang Tsong In, who had been a soldier in the Chinese territorial army of Kwangsi. The smaller band, which retained the black flag, was composed of criminals and desperate characters who had joined the band of Watsong in the hope of plunder or to escape from justice, and their new leader was formerly the most famous brigand in the province of Kwangsi. The principal settlement of the Black Flags is at Laokai, on Red river; that of the Yellow Flags at Hagiang, farther in the interior and east of that place. The Anamese subsidized the Yellow Flags, partly to act as a check upon the troublesome Black Flags, and were glad to avail themselves of both in their conflicts with the French. It was through a want of precaution against the skill and courage of the Black Flags that Garnier lost his life in 1873, and through a repetition of the same blunder Rivière suffered defeat and death in 1883. Both the Black and Yellow Flags have greatly increased in number since they were expelled from Chinese territory, the former numbering in 1883 probably not fewer than 5,000 warriors, and the latter perhaps twice as many.

French Military Expedition.—Capt. Rivière, a naval officer, obtained command of the expedition sent out for the purpose of enforcing the treaty of 1874, and embarked in October, 1881. The changes in the Foreign Office, which was directed successively by St. Hillaire, Gambetta, Freycinet, Duclere, and Challengel-Lacour, were the cause of Capt. Rivière being left with his small force in Tonquin without support or instructions, to act at his own discretion. The worthless Anamite militia offered no formidable resistance to his insignificant band of marines. He ascended to Hanoi, and took the citadel by assault, the Anamite garrison being driven out at the first onset, in May, 1882. Nothing further was done until the following spring, when the Government at home began to consider a forward movement, and the hostile natives showed signs of activity. There was no declaration of war against Anam, nor any expressed intention of effecting political changes. The declared object of the expedition was to clear the Red river of the Black-Flag pirates, and keep it open for European commerce. A desultory warfare was carried on with the natives. The Black Flags were re-enforced by Anamites and by volunteers from China, who united to harass and compel the retreat of the hated foreigners. Yet, during this time, the official assumption was that the French had to do simply with pirates, and were acting on behalf of the Emperor of Anam. After many vacillations, in May, 1883, the French Government decided to send a mili-

tary expedition on a larger scale, which would be sufficient to subjugate the country, and announced to China and Europe its intention practically to annex the province of Tonquin.

Campaign of 1883.—About the same time the fresh activity of the hostile Anamites drove Commandant Rivière to resume offensive operations. He had in vain appealed to the Government for re-enforcements. The moment was now favorable, and his fresh action was an incitement to French politicians to take up the mooted scheme of the acquisition of Tonquin. M. de Kergardec was sent to Anam as the bearer of an ultimatum of the French Government to the King Tuduc, whereby he would virtually resign the government of his country into the hands of the French, and accept the position of a mediatized Indian prince. The Assembly was asked for a vote of 5,300,000 francs to enforce these demands.

The French commander feared that the communications between Hanoi and the sea would be cut off by the entrance into southern Tonquin of the bands on the Bodé, or chief arm of the Red river, and their occupation of the country in combination with forces from Anam. Commandant Rivière therefore determined to occupy the fortress of Namdinh, the most important point in the Bodé region, commanding the river. The city is the capital of a rich province, and was one of the centers of the hostile Anamite and Mandarin sentiment. He requested the governor several times to pull down his flag and admit a French garrison, but was answered: "Why have you come here? If you want to fight, let us fight; otherwise stay away." On March 27th Rivière embarked, in seven small steamers and gunboats, a force of 800 men to attack Namdinh, which was captured after a bombardment of several hours. The same day the Anamites, in the absence of the commander and a large part of the garrison, assailed the citadel at Hanoi. Commandant Rivière telegraphed home for 2,000 more troops.

On May 15th the vote of credit for the Tonquin expedition came up in the French Chamber and was carried by a large majority. M. Challemeil-Lacour, in defending the project, characterized the objections of China as purely platonic, since it was not a military nation. There would be no conquest of Tonquin, because the King of Anam had no fighting troops, but merely a military demonstration. The expeditionary corps would occupy certain points in Tonquin until Tuduc showed a willingness to renew and revise the treaty in the desired sense. The collection of customs during the occupation would pay all the costs of the expedition. He represented that the Tonquinese were weary of the yoke of Anam and would welcome the French as deliverers. Immediately after the Chamber determined to prosecute the operations for the enforcement of the treaty, news came of the annihilation

of a French force before Hanoi, and of the death of the commander.

A heavy cannonade from the Anamite guns annoyed the French troops for several days. The Black Flags became bolder and more dangerous, and their commander sent a challenge in extravagant language, of the kind which is usual in Chinese warfare, threatening to kill the French commandant with his own hands. On May 19th Commandant Rivière called out his troops for a sortie in force. Commandant Berthe de Vilers led the column, consisting of 400 men, with sailors to draw the guns. The Anamites fell back as they took up a position in the open and advanced with confidence, until they reached the spot where François Garnier fell. Here they were brought up short by a stockade concealed by bushes, in which a strong force of Black Flags were waiting for them. A heavy fusillade was opened upon the French column, and before a shot was fired in reply 80 soldiers fell dead or wounded. Commandant Rivière attempted to bring up his artillery, and, while he and Cadet Moulin were assisting the sailors with the cannon, they were both killed. Commandant de Vilers was mortally wounded, and two other officers were killed. The soldiers retreated precipitately. When the news was brought to Saigon, Chef-de-Bataillon Chevalier was sent with 500 regular troops and two gunboats.

On receiving the news of this disaster, May 26th, the Chamber, which had been wrangling over the appointment of a civil commissioner, at once passed the bill for the expedition. Transports were dispatched under the command of Admiral Courbet, followed by others, until in July 7,000 troops were landed in Tonquin, 4,000 of whom were sent up to Hanoi. Admiral Courbet commanded the sea-forces, Gen. Bouet the land troops, and Dr. Harmand was appointed civil commissioner.

This triumvirate, in communication with the authorities at home, planned an extensive campaign. The French troops proceeded at once to take possession of the delta of the Red river. At the apex of the triangle is the city of Hanoi, and the two arms of the river constitute the lines of communication between the principal points. They already had possession of Namdinh on the southern arm. They next occupied without difficulty the seaport of Haiphong, at the mouth of the northern arm. Between the latter and the main position of the French at Hanoi the fortress of Haizuong remained in the hands of the defenders of the country. On August 13th, Col. Brionval marched on this position, and captured it without loss. About the same date, Gen. Bouet, the chief in command, undertook an expedition against the city of Sontay, on the Red river, twenty miles above Hanoi. While this operation was being carried out from Hanoi, Admiral Courbet was expected to gain possession of the forts at the mouth of the Hué river, with a squadron and a division of land-troops, and then advance upon Hué.

Gen. Bouet set out from Hanoi on the evening of August 14th, with a force of 2,000 men and six guns, advancing in three columns, one of which, commanded by Col. Revillon, followed the river, with the intention of storming or flanking the works along the bank. Five gunboats ascended the river to support the troops. The first intrenchments, not four miles from Hanoi, were vacated after a few shells had been sent into them from the gunboats. A second fortified position was speedily deserted by the Anamites. The third was the town of Phou-hai, palisaded with stout bamboo stakes. After pouring in a hot fire of shells from the vessels, Revillon's infantry advanced to the assault, but met with such vigorous resistance that they were obliged to retreat. The gunboats shelled the place again for more than an hour, but a second attack was repelled. A third was not more successful, and Revillon prepared for a final effort at the break of day.

The middle column, under Col. Coronat, had by this time advanced without meeting with any resistance, to the village of Yenoï, where it awaited the issue of the *détour* undertaken by the column on the left, commanded by Col. Thier. The latter sent out a detachment to reconnoitre, which found the road a little distance ahead closed by intrenchments and stockades. The road, leading through bogs and overflowed fields, was so narrow that the guns could not deploy properly, and the horses and wheels stuck fast in the mire. The column advanced to the point where the road was blocked by fortifications, which was at the village of Vong, beyond the spot where, on the same narrow road, Rivière had lost his life. The cannon opened fire at a distance of a thousand paces from the village. The artillery fire was not answered; but when the troops approached the fortifications they were met with a sharp fire of musketry, which drove them back. When the Anamites saw the French in retreat, they sallied in force and strove to flank the retiring column on the left, where were the Cochinchina auxiliaries and Yellow Flags, who had now joined the French. The situation in the afternoon of the 16th was at times exceedingly critical. The Anamites and Black Flags followed the French a long distance, though the latter several times turned front and poured volleys into their pursuers, supported as well as was possible by the artillery. Thier reached Hanoi by evening, and the middle column, after waiting in vain for him to join it, returned the following day.

The assault of Revillon on the morning of the 16th was successful, and the village and its pagoda were finally captured after fourteen hours of fighting, with a total loss to the French of 8 officers and 14 men killed and about 50 wounded, not counting the 30 dead and the wounded among the native auxiliaries.

The entire French force, with the exception of a small garrison in the pagoda of the captured village, was back in Hanoi by the 17th.

The continued rising of the waters necessitated the abandonment of the captured town and a cessation of operations for some weeks.

On the Hué River, in the center of Anam, the invaders met with better success. The forts at the mouth of the river were bombarded on the 18th, 19th, and 20th of August. A landing could not be made on the north bank on the 19th, but on the following day it was successfully accomplished, in spite of an energetic defense by the Anamites from behind the dunes. The fortifications on the southern bank were occupied without fighting on August 21st. Steamers took part in the bombardment, and delivered their fire to good effect. The landing force consisted of sailors from the first three vessels, two companies of marines, one of native riflemen, two batteries of native artillery-men, and 100 coolies—in all 1,050 men, with 15 guns. The French lost but a few wounded, but their shells caused severe losses on the other side, the Anamite dead numbering over 600.

The fortress of Haizuong was captured August 19th, by a sudden assault which was so well conducted that the Anamites had no time to spike their guns, and fled in disorder into the interior. This town is the capital of a province, and has a population of 80,000. It was strongly fortified with palisades, after the Anamite manner, and occupies a commanding site on the Taibigne arm of Red river.

After the capture of the fortifications at the mouth of the Hué a truce was made, and Dr. Harmand, the civil commissioner, with M. de Champeaux, the deputy of the Governor of Cochinchina, went to Hué in the Bayard, escorted by two small steamers, with a guard of 90 marines, to negotiate for peace. Reinforcements were sent from France to hold the positions, and a blockade was declared.

The Treaty of Hué.—King Tuduc, the determined enemy of the French, had died in July, and was succeeded by Vian Lau, also an adherent of the war policy. But on the capture of the Hué forts the new King and his court fled in consternation into the interior, leaving the throne vacant. His rival, Hiep Hoa, or Hiephma, the leader of the peace party, who was amenable to French influences, now assumed the supreme power, and at once sent a request that Dr. Harmand come to Hué to negotiate terms of peace. A treaty was drawn up and signed August 25th. The articles provided for the payment of a war indemnity; the cession of the province of Bin Thuan to France; the recall of Anamite troops from Tonquin, and the transfer of the command of the Anamite army to Gen. Bouet, who would employ the troops, lately in the field against the French, to expel the Black Flags from Tonquin; the confirmation of the French protectorate, established by the treaty of 1874; the opening of the ports of Quinhon, Turon, and Quangai to commerce. The treaty stipulated furthermore that the French should have

control over the Anamite finances and customs, and should permanently occupy the forts at the entrance of the harbors of Hué and Turon. In Tonquin they engaged to preserve order, establish good government, and clear the country of pirates. The right to maintain an armed force there, and to occupy any military positions that were deemed necessary for these objects, was also reserved.

On September 1st, although the country was still inundated, the French advanced within twelve miles of Sontay, to the village of Pallan, where they found the enemy in casemated forts, on which the gunboats produced no effect. After three days of fighting, they carried the works by storm. Leaving 800 men with a gunboat to hold the position, Gen. Bouet returned to Hanoi to await re-enforcements before marching upon Sontay. The Black Flags about this time became more aggressive, interrupting traffic on the Songcoi, and occupying posts within 5 miles of Hanoi.

Differences between Dr. Harmand and Gen. Bouet, who by the terms of his instructions was obliged to act in concert with the civil commissioner, led to the recall of the military commander. Admiral Courbet took command of the armed forces, and in the middle of October Dr. Harmand's joint direction in strategical matters was taken away.

Operations were then suspended until October. The citadel of Ninhbinh was occupied without opposition by Col. Badens on October 18th, and Phunor, near the coast, on the 21st. The pending negotiations with China were a cause of delay in the operations. When the advance upon Bacninh was contemplated and the capture of Sontay about to be undertaken, the Marquis Tseng informed the French Government that they would come into collision with the Chinese regular troops, and that the Chinese Government was determined to defend those points. These Chinese garrisons had been in Tonquin since 1870 or earlier. They had been sent at the solicitation of Tuduc to suppress brigandage, and had accomplished that task at a cost to the Imperial Government of a million dollars. The Marquis broke off all communications with the French Government at this point. The French minister declared in the Chamber that the attitude of the ambassador was disavowed by his Government, but this was promptly denied in a dispatch from Peking. The French ministry asked for a further credit of 9,000,000 francs to strengthen the expeditionary force, and continue the operations in 1884, which was sanctioned by the Assembly.

On November 17th the garrison at Haiznong had to sustain a severe attack by Black Flags, which was only repelled by the aid of the gunboat Lynx, that arrived unexpectedly.

Before the middle of December Admiral Courbet advanced with the main body of his troops against Sontay, and fighting began on the 14th, the flotilla assisting. The attack upon the fortifications began at eleven o'clock,

and the outer works were carried in the evening by the Algerian troops, together with the infantry, marines, and sailors. The losses were reported by the correspondent of the "New York Herald" to be nearer 1,000 than 200 men, as officially stated. The Chinese, Black Flag, and Anamite garrison began to withdraw, but kept up the defense until the 17th, when the French entered the town. The citadel was still held by the Black Flags, who were expelled after another fight on the 18th.

This victory severely crippled the French army, and the Government prepared to send a much larger force than had been deemed necessary before testing the quality of the Black Flags and the Chinese troops. The movement against Bacninh was postponed until the next year. Re-enforcements were sent which raised the strength of the French army to about 25,000 men, besides 5,000 or 6,000 Cochinchinese auxiliaries. The cost of the new expedition, with the amount already expended, was about 48,000,000 francs. Additional credits to cover this were voted in December. Gen. Millot was selected to take command of all the forces. The question of occupying the islands of Formosa, Hainan, and the Chusan group, and exacting a heavy indemnity from China, was discussed. At the end of December Hunghoa, another important point, was captured. In the beginning of December there was another change of rulers in Anam. The King Hiepma was poisoned by his subjects for his submissiveness to the French. His successor was Hiephoa, a youth of fifteen, a nephew of Tuduc. The French hastened to reduce the new King to a state of subjection. A French garrison took possession of the citadel of Hué, while the French diplomatic agents, M. Champeaux and M. Tricon, who had been recalled from the futile mission to Peking, imposed their authority upon him without reserve. Although they held the King in their power, and had a large army in Tonquin in possession of every strong position in the delta, yet the French were far from being masters of the country, which swarmed with enemies.

TUBERCLE BACILLUS. The discovery of a microscopic organism supposed to hold a constant causative relation to tubercle in the lung marks one of the advances in medical science of the past year. The bacilli are believed to be present in all cases of fully-developed phthisis, as well as in cases which are still in the early stage and exhibit no physical signs. They are not found in chronic, non-phthisical pulmonary affections; and the quantity present seems to bear no relation to the intensity of the morbid process, and hence has no prognostic value. The conditions necessary for the generation of phthisis are found first in the presence of bacilli in the lungs, and, second, in an hereditary or acquired predisposition which favors the occurrence of congestive and inflammatory changes in the lungs, par-

ticularly at the top, where the circulation is naturally retarded. The coexistence of these two factors seems to be essential to the production of true pulmonary phthisis. The treatment of the disease must regard both of these factors, and hence the indications are, first, to promote the general health, improve the condition of the blood and of the vessels, and exercise the respiratory function, in order to prevent stagnation of the blood and inflammation in the apices of the lungs; second, to prevent the access of bacilli, and to destroy them by antiseptic applications when they have once effected an entrance.

For the detection of the tubercle bacillus under the microscope, two solutions are necessary, one of magenta, which colors the bacillus, and one of chrysoïdine, which colors the surrounding substances but spares the bacillus. The formula for the magenta solution is as follows:

Magenta crystals.....	2 grammes.
Aniline, pure.....	8 grammes.
Alcohol.....	20 grammes.
Distilled water.....	20 grammes.

The solution of chrysoïdine is prepared by making a saturated solution of chrysoïdine in distilled water, then by adding a crystal of thymol in a little absolute alcohol to preserve the solution. It is also necessary to have a dilute solution of nitric acid (one part of the acid to two parts of distilled water). A fragment of tuberculous expectoration is placed on a glass and allowed to dry; it is then passed three or four times through the flame of a lamp, and again allowed to cool. A few drops of the magenta solution are placed in a small glass, which is exactly covered with the glass holding the sputum, the latter being in contact with the coloring fluid without the interposition of any air. It is left thus for fifteen or twenty minutes, and then treated with the nitric acid, which removes all the coloring-matter in a few minutes. It is then washed in distilled water and subjected to chrysoïdine, which colors the entire preparation, again washed in distilled water, then treated with absolute alcohol, dried, and mounted in Canada balsam. The bacillus is so highly colored as to be visible to the most inexperienced with a low magnifying power.

TUNIS. See page 858.

TURGENIEFF, Ivan Sergyevich, a Russian novelist, born at Orel, Nov. 9, 1818; died at Bongival, near Paris, Sept. 3, 1883. He came of a noble and ancient family, was taught by French and German tutors on his mother's estate, learned English in the Lasareff Institute at Moscow, entered the University there at the age of sixteen, proceeded to the St.

Petersburg University after the death of his father in 1833, and, after graduation, went to Berlin in 1838 to study history, philosophy, and the classics. Returning in two years to St. Petersburg, he was appointed to an office in the Ministry of the Interior. He published his first poem, "The Old Proprietor," in 1841, and continued to write poetry until 1846, but attached little value to these productions. In 1843 appeared a dramatic sketch in prose, and in 1844 his first novel, "Andrei Kolossoff," which attracted little attention. Those which followed, however, were received with avidity. They were published under the initials "T. L." (Turgenieff-Lutovitoff), but the pseudonym was soon deciphered by curious inquirers. The first of the sketches of serf-life, collected in "Memoirs of a Sportsman" (1852), appeared in the "Contemporary Review," in 1847. The effect of these natural and life-like pictures of the narrow joys and many sufferings of serfdom was like that produced in the United States by Mrs. Stowe's "Uncle Tom's Cabin." They raised Turgenieff to the highest rank in Russian authorship, and created, among the serf-owning class, his first political ene-

IVAN SERGYEVICH TURGENIEFF.

mies. The Emperor Alexander declared that this book first turned his mind to the question of liberation. The last of these sketches appeared in 1857. A French translation was

published the same year, and a German translation in 1858. Other contributions to Russian magazines, tales, dramas, and critical essays, with an occasional article in the *Revue des deux mondes*, were published during this period. In 1852 Turgeneff drew upon himself the vengeance of the bureaucracy by uttering some sharp, but not illegal, strictures on Russian officialism, in a notice of Gogol, after the latter's death. For this he was deprived of his office, thrown into prison, and then banished to his estate in the distant Government of Orel. After this decree was canceled, through the intercession of the Grand Duke Alexander, afterward Alexander II, in 1854, he lived most of the time abroad, first in Baden-Baden, and then in Paris. In 1859 appeared "A Nest of Nobles," a novel, which attracted much attention. The next novel, "Fathers and Sons" (1862), created a sensation such as had never before been stirred up in Russia by a literary production. It depicted, in artistic contrast and with realistic candor, the conservative and the radical phases of political life in Russia. Both schools were indignant at his analysis of their feelings and motives, most of all the holders of advanced opinions akin to his own. The epithet "Nihilist," which he attached to the materialistic and revolutionary tendencies, was accepted by the party of action and caught up by the Government, which applied it to all democratic and socialist aims. This work was translated into English by Eugene Schuyler. It was succeeded by "Smoke" (1867), in which the author's own views of the future of Russia were expounded. This widened the breach made between him and the school of thought with which he most sympathized by his objective delineations. His friend Nekrasoff, editor of the "Contemporary Review," was alienated, and the students of Russia turned against him. While he was branded as a renegade by his own party at home, the admirers of his genius multiplied in France, Germany, and the English-speaking countries. In purity of style, as well as in the power of exploring the human soul and touching the springs of sentiment and action, and in minuteness of observation and circumstantial naturalism, he resembled Balzac, with a satirical quality added, recalling the incisive humor of Thackeray. His principal subsequent work (1877) described the life and activities of the secret revolutionary party. It was translated into English under the title "Virgin Soil." Though he was denounced as a reactionist by the Liberals of Russia, the Nihilists claimed him as a friend and sympathizer. In the later years of his life public opinion turned again in his favor. His sorrow at being misunderstood and deserted by his former friends, and the intensity of his patriotism, are revealed in the poems in prose, published under the title of "Senilia" (1883). His last novel, "Olara Militch," is a mystical romance of an original stamp. A collection of his earlier novels and

tales was issued in 1856, and a complete collection of his writings appeared in 1865, at Carlsruhe, and was reprinted in several editions at Moscow.

TURKEY, an empire in Europe and Asia. The fundamental laws are derived from the precepts of the Koran and the *Multeka*. When not in conflict with the sacred Mohammedan laws the will of the Sultan is absolute. The Constitution proclaimed by Abdul-Hamid, Dec. 23, 1876, is modeled upon European forms of government; but, like the previous Constitution of Sultan Abdul-Medjid, it has not been carried into effect. The reigning Sultan is Abdul-Hamid II, born Sept. 23, 1842, who succeeded to the throne upon the deposition of his brother Murad, Aug. 31, 1876.

The executive and legislative authority is exercised under the Sultan by the Grand Vizier, who is the head of the temporal government, and the Sheik-ul-Islam, who is the chief interpreter of the Koran and head of the Ulema, or council summoned to expound the laws.

The Grand Vizier and President of the Council of Ministers is Said Pasha; the Sheik-ul-Islam, Ahmed Essad Effendi.

Area and Population.—The Treaty of Berlin reduced the area of the dominions under the rule of the Sultan in Europe from 188,264 to 56,868 square miles, and the population from 8,315,000 to 3,982,000. The area and estimated population of the divisions of the Ottoman Empire, including the vassal and tributary states, are as follow:

GEOGRAPHICAL DIVISIONS.	Square miles.	Population.
Europe:		
Immediate possessions.....	63,850	4,900,000
Eastern Roumelia.....	18,500	815,961
Bosnia, Herzegovina, and Novi-Bazar.....	23,570	1,824,440
Bulgaria.....	24,969	1,996,938
Total Europe.....	110,889	8,681,400
Asia.....	739,850	16,172,000
Africa:		
Tripoli.....	898,878	1,010,000
Egypt.....	1,162,980	16,400,000
Total Africa.....	1,561,858	17,410,000
Total Turkish Empire....	2,896,692	42,212,400

The population of Constantinople is between 600,000 and 700,000.

Fully half the population of Turkey in Europe, about 17½ per cent. of the population in Asia, and about 23 per cent. of the total population of the empire, are Christians of the various Oriental and Occidental rites, and Jews.

Commerce.—The total imports in the year 1878-'79 are reported as amounting to 1,969,498,742 piasters (1 piaster = 4.3 cents), the exports as 839,586,490 piasters; the imports of 1879-'80 as 1,981,408,524 piasters, the exports as 863,209,246 piasters. The year 1880-'81 was unfortunate in every respect. The majority of the farming population did not produce

enough food for their needs, and were obliged to borrow money at high rates of interest. The importation of food-stuffs amounted to 3,600,000 Turkish liras (about \$18,200,000), the exports to 600,000 liras. Another such disastrous year would have brought famine, but happily average crops were obtained in 1881-'82. The total exports of 1880-'81 amounted to about 9,800,000 liras (\$41,850,000), including 6,958,581 okes (about 19,715,000 pounds) of tobacco, which pays no export duties. The values of the leading exports were as follow: raisins, 998,558 liras; tobacco, 810,000 liras; raw silk, 836,500 liras; opium, 447,618 liras; valonia, 377,258 liras; olive-oil, 347,876 liras; coffee, 346,852 liras; cotton, 289,510 liras; figs, 225,235 liras; sheep and goat skins, 224,514 liras; sesame, 205,455 liras; soap, 199,474 liras; wheat, 219,022 liras. The export of raisins to France for the manufacture of wine has recently sprung up and become the most important branch of the export trade. Since the rise of this demand a large part of the coast regions has been planted to vineyards.

The Army.—The reform in the military organization, approved by the Padishah in April, 1880, has made considerable progress, though retarded by the lack of financial means and the opposition of the older officers, whose emoluments are threatened with diminution. The army is divided into the *nizam*, or active army; the *redif*, or reserve; and the *mustahfiz*, or levy in mass. The duration of military service in the three bans is twenty years, of which six are passed in the active army and its reserve. The war effective of the active army is to be 610,200 men, with 1,512 guns. The actual strength of the *nizams* in 1883 was 10,311 officers and 150,106 men, with 650 guns. There is great lack of horses and war material, though contracts have been made in the United States and Sweden for rifles, torpedoes, etc.

Finances.—The budget for the year ended March 13, 1881, makes the total revenue 16,155,840 liras, and the expenditure 19,148,763 liras. A commission appointed to inquire into the condition of the finances reports that for 1882-'83 the total revenue amounts to 15,000,000 liras, and the expenditures to 20,340,000 liras. Estimates for 1883-'84 make the total revenue 16,313,006 liras, and the current expenditures of the Government 12,126,001 liras, leaving 4,187,005 liras for the state creditors.

The loans of 1858, 1860, 1862, 1863-'64, 1865, 1869, 1872, and 1878, consolidated at 5 per cent. interest, and the railroad debt, represented by the Turkish lottery bonds, amounted to £190,997,980 and the defaulted interest to £61,803,905. The Turkish Government began contracting a foreign debt in 1854. Except the guaranteed loan of 1855, £5,000,000 in amount, bearing 4 per cent. interest, the various loans, bearing interest at 6 and 5 per cent., were issued at a discount ranging from 30 to 60 per cent. In 1875, when the borrowing

power of the Government was quite exhausted, the creditors were notified that only half the interest would be paid in money, and the following year it was announced that no more payments would be made until the internal affairs of the empire were more settled. In July, 1881, delegates from the bondholders met at Constantinople and effected an arrangement with the Government. The Council of Administration, created under this arrangement, took charge of the ceded revenues in March, 1882. One fifth of the product is to be applied to the reduction of the capital, and four fifths to be paid out in interest. The interest is never to exceed 4 per cent., and when the yield of the ceded revenues exceeds 5 per cent. of the debt in amount, the surplus is to be turned over to the treasury. The quotas of Servia, Greece, Bulgaria, and Montenegro, in the expenses of the public debt, are to be applied to amortization.

The Council of Administration paid in September, 1882, and March, 1883, the semi-annual interest at the rate of 1 per cent. on the reduced amount of the consolidated debt. Arrangements are made for a tobacco *regie*, to begin operations in April, 1884.

Revision of Commercial Treaties.—The Porte took the opportunity of the expiration of the treaties of commerce with England, France, Italy, Russia, and the United States, to secure an augmentation of its revenues by increasing the customs duties. It proposed to abolish ad valorem duties and substitute for them specific duties, adopting provisionally, pending the negotiations, a general ad valorem rate of 8 per cent. The proposal was resisted resolutely by the interested governments, particularly Great Britain and the United States. The British Government, in the interest of the Lancashire cotton-manufacturers and other English importers, insisted on being treated, under the most-favored-nation clause, on the same terms with Germany, whose commercial treaty has yet eight years to run. Gen. Wallace, the American minister, contested particularly the increase in the duty on petroleum. The imports of American petroleum are so large, amounting in 1882 to 400,000 cases, and the demand for this article so strong, that the Turkish Government expected to derive from this source a large and steady accession to its income. The British Government likewise objected to the application to British subjects of the tax for trade-licenses, a newly-established source of revenue and one of those which were abandoned to the bondholders.

The Armenian Question.—The Porte had thrice promised Great Britain to carry out administrative reforms in the Armenian vilayets. Minister Layard obtained the promise of a gendarmerie under English officers to defend the Armenian Christians from the violence and oppression of the Kurds and Circassians. An article in the Treaty of Berlin provided for Armenian reforms, and the special convention be-

tween England and the Porte, concluded prior to the Berlin Congress, treats of the reform of Turkish administration throughout Asia Minor. The interest of England in Armenia is chiefly negative. It is to prevent the advance of the Russians, who crossed the Caucasus in the beginning of the century and established their power in ancient Georgia, and then acquired successively the Persian khanate of Erivan, Turkish Georgia, and after the last war a part of Turkish Armenia. They not only have a large army within striking distance, but have acquired great influence over the Armenians. Upon their approach, the Armenian question loomed up, ancient history was searched for records of the kingdom of Armenia, grievances became chronic, and soon the Sultan had an "Asiatic Bulgaria" to reckon with. Relying on the sympathies of the Russians and of the English, a party in Armenia conceived that, if they showed the proper degree of spirit and resolution, their rival protectors would force the Sultan to grant them an independent government. The revolutionary agitation advanced at the close of 1882 to the stage of insurrection, and an attempted rising took place at Erzerum. The Ottoman Government, which has really lived in the best accord with the Armenians for centuries, proceeded energetically to crush the incipient revolution. The leaders were put on trial for high treason. Authors of revolutionary songs and other appeals were imprisoned or banished. The trial for treasonable conspiracy resulted in the conviction of the prisoners, but the Porte, deeming the sentences too severe, and moved by the intercessions of the foreign patrons of the Armenians, ordered a new trial. The Mohammedan brigands took license from the new condition of affairs, and committed many outrages on Armenians and Greeks. The English

Government renewed its efforts to secure Armenian reforms, and, before Lord Dufferin's departure for Egypt, representations were made to the Porte. The Turkish Government, more reluctant even than usual to submit to foreign dictation in its internal affairs, evaded action by the old device of promising to consider the question of a comprehensive reform in all the Asiatic provinces.

Cretan Troubles.—The spirit of rebellion, which is always latent in Crete, owing to the large degree of autonomy already extorted by insurrection and foreign pressure, came to an outburst again in 1888, as it usually does after a period of prosperity. The immediate cause of the ferment was a controversy over the Vasouf taxes. About half the real estate of the island is affected to the mosques, partly by the assignment of the revenues of certain villages by the Sultan, and partly by the bequest of proprietors. The imperial taxation was abandoned by the convention of 1878, which conferred practical autonomy on the island, to the Assembly. The Vasouf taxes amount to about one sixth of the total obligations of the island. The diversion of so much of the revenue to the support of the Mohammedan religion, which is professed by only one fifth of the population, is a cause of dissatisfaction. The Assembly, on June 8, 1888, passed a resolution declaring that the religious taxes would no longer be paid, distinguishing the taxes from the rents from property given to the mosques. Photiades Pasha, the governor, was directed to collect the taxes, by force if necessary. After appealing to the people in vain, he sent a body of troops into Apokorona; but the whole population rose against the military demonstration and drove out the troops, and, when he ordered another force into the province of Canea, the officers resigned.

U

UNITED STATES. There were comparatively few important official changes under the United States Government during the year. Postmaster-General Timothy O. Howe died on March 25th, and on April 4th Judge Walter Q. Gresham, of Indiana, was appointed to the vacant place, it having been decided by the Attorney-General that under the law the duties of the office could be performed by a person temporarily designated for a period of ten days only. Mr. Gresham was born at Corydon, Ind., March 17, 1838. He was graduated from Bloomington University, and entered upon the practice of law in his native county. He served in the State Legislature prior to 1861, and after the outbreak of the civil war entered the military service as lieutenant-colonel of the Thirty-eighth Indiana Regiment. He was a brigadier-general under Grant in the Vicksburg campaign of 1863, and was in command of a division under Sherman before Atlanta in 1864, where

he received a severe wound in the leg. The brevet title of major-general was given him in 1865. He took a somewhat prominent part in politics after the war, and was twice a candidate for Congress against the late M. C. Kerr, but was defeated. Judge William C. Woods, of the Supreme Court of Indiana, was appointed to succeed Judge Gresham as United States District Judge on the 2d of May. Gen. Green B. Raum, Commissioner of Internal Revenue for nearly seven years, resigned on April 28th, and on May 21st Walter Evans, of Kentucky, was appointed as his successor. United States Treasurer James Gilfillan resigned on April 1st, and the Assistant Treasurer, A. U. Wyman, was appointed to the place. Edward O. Graves, chief of the Redemption Bureau, was made Assistant Treasurer. Pierre C. Van Wyck, Superintendent of the Assay-Office in New York, died in April, and on the 24th of that month, Andrew Mason, previously the melter

and refiner in that office, was advanced to the post of Superintendent. On September 1st Mr. Marble retired from the office of Commissioner of Patents, and Benjamin Busterworth, of Ohio, was subsequently appointed to that office.

Some slight political agitation was caused by official changes in New York city at the beginning of March. Elibu Root was appointed District Attorney in place of Stewart L. Woodford, who had sought a reappointment. Naval Officer Silas L. Burt was superseded by Charles K. Graham, previously Surveyor of the Port; James L. Benedict was made surveyor; A. P. Ketchum was promoted from general appraiser to appraiser of merchandise; and Andrew J. Perry was made general appraiser.

Appointments made during the year in the diplomatic service were: Lucius H. Foote, of California, Minister to Corea; Seth Ledyard Phelps, of the District of Columbia, Minister to Peru; John W. Foster, of Indiana, Minister to Spain; W. W. Thomas, Jr., of Maine, Minister to Sweden and Norway; Richard Gibbs, of New York, Minister to Bolivia; Wickham Hoffman, of New York, Minister to Denmark; S. G. W. Benjamin, of New York, Minister to Persia; Dwight T. Reed, of New York, Secretary of Legation at Madrid.

Foreign Relations.—In reply to a resolution of inquiry from the Senate, the Secretary of State, on February 27th, submitted to the President the following explanation regarding the action of the American Minister to Peru:

The Secretary of State has the honor to report that he received a dispatch from Mr. Partridge, who stated that for reasons therein given the representatives of Great Britain, France, Italy, and the United States (Germany declining to take any part) were led to consider, at an informal meeting at Mr. Partridge's house, by what mode a solution of the existing difficulties might be reached. Mr. Partridge and his colleagues accordingly agreed on a memorandum which was to be sent by each of the ministers to his own Government as setting forth their views and hopes. The ministers state in substance that they are unanimously of the opinion that each should declare to his Government that they believe the only possible means of bringing about a cessation of hostilities, of saving Peru from complete destruction, and of arresting the ruin of neutrals, would be an agreement between the Governments to address representations to the Chilean Government, and cause it to understand that their wish is to see peace made on the basis of a cession of Tarapacá, reserving all further conditions for further negotiation. The ministers further declare that they consider it a duty to invite their respective Governments to agree among themselves to take the step indicated at once as an urgent necessity. Upon the receipt of this dispatch Mr. Partridge was telegraphed by the Secretary of State in substance that the leave of absence which he had requested was granted, and that he was expected to return to the United States by the first steamer. He was further informed that the action set forth in his dispatch having been taken by him without authority, was disapproved, and he was directed to so inform those of his colleagues who had acted with him. A telegram was at the same time sent to the Ministers of the United States in London, Paris, and Roune, informing them that Mr. Partridge had joined with the representatives of Great Britain, France, and Italy in a recommendation to their respective Governments to intervene in the Chili-Peru difficulties, and instructing them to in-

form the Governments to which they are respectively accredited, that this action was taken by Mr. Partridge without authority, and has not been approved.

Ratifications of new trade-mark and extradition treaties between the United States and Spain were exchanged at Washington on April 15th. The former was intended to secure reciprocal protection in the exclusive use of trade-marks in the two countries, and the latter increased the list of crimes for which extradition would be granted, adding embezzlement, kidnapping, extorting money or other property by threats of injury, false devices, etc. A commercial agreement was negotiated by Minister Foster at Madrid, involving the removal of differential duties between the United States and the Spanish colonies. (See page 649.)

Among the extensions of the diplomatic relations of the United States effected during the year, was the appointment of a minister resident and consul-general at the capital of Persia. Mr. S. G. W. Benjamin was appointed to that post, and arrived at Teheran in June. Treaty relations with Corea were perfected by an exchange of ratifications on May 15th at Seoul. An American representative remained at that capital, and a Corean embassy visited the United States during the year to learn something of their institutions and promote commercial intercourse. A Chinese consulate was established in New York in June, the first incumbent being Ow Yang Ming.

Consular and commercial treaties with Servia and Roumania were perfected and proclaimed during the year, and a new treaty was effected with Madagascar. Notice of the termination of the fishery clauses of the Treaty of Washington was given by the President, in pursuance of a joint resolution of Congress, to take effect July 1, 1885. The sending of pauper emigrants from Ireland by government assistance was the subject of remonstrance, and assurance was received that precautions would be taken to prevent it in the future. The action of France and Germany in prohibiting or restricting the importation of the pork products of the United States was also the subject of correspondence which reached no definite result. (See PORK, PROHIBITION OF AMERICAN.)

Political Movements.—The general political movements of the year were without special importance. The National Committee of the Republican party held a meeting at Washington on Jan. 17th to consider the basis of representation and the method of selecting delegates for the next National Convention. Stephen W. Dorsey, of Arkansas, resigned the post of secretary of the committee, and John A. Martin, of Kansas, was chosen in his place.

Two propositions were offered for securing representation proportioned to the strength of the party in the different States. One of these, offered by Mr. Martin, of Kansas, would give to each State four delegates-at-large and one for each congressional district, and an additional

delegate-at-large for every 12,000 votes cast for Republican electors in 1880. That submitted by Mr. Chandler, of New Hampshire, gave to each State four delegates-at-large, with one additional for every Republican senator, and two delegates from each congressional district, with one additional for each Republican representative in Congress. These plans were antagonized with the proposition that the old basis of four delegates-at-large for each State, two delegates for each congressional district, and two for each Territory and the District of Columbia, be retained. This was adopted by a vote of 21 to 17. The following resolution was adopted after some debate:

Resolved, That the Republicans of the various congressional districts shall have the option of choosing their delegates at separate conventions held within the districts, or by subdivision of State conventions, but all district delegates selected shall be accredited by the officers of such district conventions.

It was decided that State conventions should be held not less than thirty nor more than sixty days before the National Convention, and that separate district conventions, when held, should be within fifteen days prior to the State Convention. The question of holding the next National Convention was decided in favor of Chicago, and Tuesday, June 8, 1884, was fixed as the date. The Democratic National Committee made no preparation during the year for the convention of the party.

There was a convention of delegates of the colored race from various parts of the country at Louisville, Ky., in September. It was characterized by a good deal of excitement, arising out of antagonistic feeling in regard to declaring in favor of the adhesion of the race to the Republican party. On the last day, September 27th, an address to the people of the country was adopted, of which the following are the most significant passages:

We do not ask for any more class-legislation. We have had enough of this. But we do believe that many of the laws intended to secure to us our rights as citizens are nothing more than dead letters. In the Southern States, almost without exception, the colored people are denied justice in the courts, denied the fruit of their honest labor, defrauded of their political rights at the ballot-box, shut out from learning trades, cheated out of their civil rights by innkeepers and common-carrier companies, and left by the States to an inadequate opportunity for education and general improvement.

We regard the labor question, education, and sound moral training paramount to all other questions. We believe that these questions, especially in the South, need recasting, and that the plantation credits and mortgage system should be abolished; that honest labor should be remunerated; that the landholders of the South should recognize that this question is to be solved by encouraging the negroes to industry, to frugality, and to business habits by inciting them to habits of thrift, by assisting them to acquire an interest in the soil, by paying them honest wages for honest work, and by making them contented and happy in the land of their nativity.

A National Free-Trade Conference was held at Detroit. On the last day, June 1st, an address was adopted setting forth the demands

of those taking part in the conference, and officers were chosen, David A. Wells, of Connecticut, being president. The following are the material passages of the address:

American manufacturers need cheaper materials in order to contend successfully in the markets of the world against foreign competitors. The protected manufacturers are few among the many, and even these have generally been hindered rather than helped by so-called protection. American labor, even in protected industries, is discovering that it gets no higher wages by protection; that it can buy less with its money and can save less. The poorer a man is the more the tariff hurts him. The higher wages which generally prevail in America are due to superior advantages which would be increased by the removal of the tariff restrictions. While there is absolute free trade in labor, and manufacturers can import the cheap labor of Europe, the laborer is denied the right to buy goods in the cheapest market. The Government of the United States has no constitutional or other right to impose taxes on the people except with the intent and result of getting sufficient money in the public treasury to pay the public debt, provide for the common defense, and provide for the general welfare; and all tariff taxes called protective, laid with different intent and result, ought to be abolished. We favor the promotion of reciprocity and the repeal of the navigation laws which have destroyed our merchant marine. We do not counsel the immediate formation of a new party, though we recognize that many Republicans and many Democrats are losing faith in their own parties and desire to unite politically for genuine revenue reform. But in case the existing parties, in their utterances, in their candidates, or in designating their leaders in Congress, persistently oppose or evade reform, we advise revenue reformers to prepare for independent political action.

Some time before the meeting of Congress in December, an unusual contest was developed over the speakership of the House of Representatives, owing to different tendencies in the Democratic party on the tariff question. Samuel J. Randall, of Pennsylvania, was known to be an advocate of the policy of protection for American industry, and was supported for the speakership on the ground that he would be opposed to reopening the question of tariff revision. He was also understood to favor the abolition of all internal revenue taxes. John G. Carlisle, of Kentucky, was a prominent advocate of a further revision of the tariff and of the principle of a tariff for revenue, with only such incidental protection as might accrue from duties arranged primarily with a view to meeting the financial needs of the Government. He was not favorable to an immediate repeal of the internal revenue taxes. Samuel S. Cox, of New York, whose views on the tariff question were not materially different from those of Mr. Carlisle, was also a candidate for Speaker, but his support rested largely on considerations of locality and long service in the House of Representatives. A caucus of Democratic members of the House was held on the eve of the session of Congress, when on the first ballot Mr. Carlisle received 106 votes, to 52 for Randall, and 80 for Cox. He was thereby made the Democratic candidate for Speaker, and received the full support of the members of his party, being elected over J. W. Keifer,

of Ohio, the Republican candidate. There had been some opposition to Mr. Keifer among the Republicans, and an effort was made to secure his withdrawal before the caucus.

Second Star-Route Trial.—The second trial of the alleged Star-Route conspirators continued until about the middle of June, and ended in an acquittal. (For an account of the first trial and beginning of the second, see "Annual Cyclopædia," 1882, pp. 758-767.) Special incidents of the second trial were the substitution of a plea of "guilty" for that of "not guilty," on the part of Montfort C. Rerdell, and his testimony for the Government against the other defendants, and the testimony of Thomas J. Brady, S. W. Dorsey, John W. Dorsey, and Harvey M. Vaile, in their own behalf. The taking of evidence closed April 12th. Mr. W. W. Ker occupied several days in summing up for the Government, finishing on April 27th. He was followed by George Bliss on the same side, who spoke for seven days, closing May 8th. A question arose as to the right of the Government to two closing addresses, the plea of counsel being that Mr. Merrick should make the principal closing address, to be followed by the Attorney-General. When the point was discussed, a letter from the Attorney-General to Mr. Merrick was read, in which he argued in favor of that method.

Judge Wylie said the former arrangement had been a matter of agreement between counsel, and he saw now no reason for departing from the usual rule. It was the universal practice in jury cases to allow only one reply to the Government, and that order would be preserved in this case. The argument for the defendants was begun by Mr. Wilson on May 9th. He was followed by other counsel, the longest address being made by Robert Ingersoll. The final summing up for the prosecution by Mr. Merrick began on May 28th, and was finished on June 8th. The charge to the jury was delivered on June 12th. In its interpretation and application of the law there was no material variation from the charge on the first trial. The jury retired on the evening of June 12th, and on the morning of the 14th rendered their verdict, "Not guilty as indicted."

On April 18th, William P. Kellogg was indicted for receiving money while a Senator of the United States for services rendered in relation to a Star-Route contract, and Thomas J. Brady was indicted for receiving money while Second Assistant Postmaster-General, in relation to the same matter. Pleas in abatement were overruled in July, as were also motions to quash the indictments. Postponements took place, and the case did not come to trial during the year.

The Army.—There was no material change during the year in the force of the United States army, or the manner of its employment. On November 1st it consisted of 2,143 officers and 23,335 enlisted men. The only warlike incident of the year was the pursuit of a band of Indians into Mexico and the capture of a part

of it by Gen. Crook, of the Department of Arizona. This band belonged to a branch of Apaches known as the Chiricahuas. They crossed the frontier from Mexico on March 21st, and made a raid through southern Arizona and New Mexico, running off cattle and horses and plundering and terrifying the inhabitants. They moved with such rapidity that the troops in pursuit failed to come up with them before they had again crossed the border and betaken themselves into the fastnesses of the Sierra Madre mountains. One of the number, Pe-Nal-Fisher, known by the *sobriquet* of "Peaches," had deserted and made his way to the San Carlos Agency, where he was seized and turned over to Gen. Crook. He agreed to conduct that officer to the stronghold of the hostile savages in the Sierra Madre, on the border-line between the Mexican States of Sonora and Chihuahua. Gen. Crook concluded to trust him and accept his services. On the 1st of May he left San Bernardino Springs with 193 Apache scouts, commanded by Capt. Emmett Crawford, Third Cavalry, assisted by Lieuts. C. B. Gatewood, Sixth Cavalry, and J. O. Mackay, Third Cavalry, and Capt. A. R. Chaffee's company of the Sixth Cavalry (42 enlisted men and two officers, Lieuts. Frank West and W. W. Forsyth). This force was the maximum which could be supplied by the use of every available pack-animal in the department. They had supplies, field rations for 60 days, and 150 rounds of ammunition. Officers and men carried only such clothing and bedding as were absolutely necessary, and instead of keeping up their own messes shared the food of the packers. The pack-train comprised over 350 animals. The forced march southeast down the San Bernardino, through a country that had been completely laid waste by the Apaches. Following a trail under the guidance of "Peaches," they entered the Sierra Madre on the night of May 8th. In his report, Gen. Crook said:

The indications of the proximity of the enemy had now become so marked that I concluded to keep the pack-trains back in the stronghold guarded by Chaffee's company, while the Apache scouts under Crawford should scour the country in front and on our flanks. On May 15th the scouts discovered the camps of Indians, which were afterward found to be those of Chato and Bonito. In accordance with my careful instructions, they would have been surrounded but for the fact that some of the scouts incautiously fired upon a buck and squaw. The surprise was complete, and in the subsequent fight, which lasted several hours, the Indians were thoroughly beaten, the camps and their contents captured, and five half-grown girls and young boys taken prisoners. Nine dead Indians were found afterward that had been killed in the fight, the extremely rugged nature of the country, the camps being situated half-way up the face of a precipitous mountain, gashed with ravines and arroyos, preventing any exact count being made without extreme danger from the Indians who might be wounded or hidden in the rocks. The eldest of the captive girls said that, if permitted, she would go out to her people and have a delegation of them come in next day, as she was sure they wanted to make peace. Her manner satisfied me of her sincerity, and I allowed her to leave the camp.

After considerable parley with messengers from the Indians, all the chiefs surrendered. They desired to make peace, and to be placed on the San Carlos Reservation. Efforts to bring in the scattered warriors were but partly successful, and when Gen. Crook felt compelled to begin his return march on account of his scanty supplies, he had with him 384 Chiricahua Indians and six Mexican captives who had been found in their possession. Other Indians were to be sent in afterward according to agreement with Hieronymo. The force reached the supply-camp at Silver Springs, Arizona, on June 10th, and 52 warriors and 273 women and children were sent to the San Carlos Reservation. Gen. Crook strongly urged the retention of the surrendered Indians and such others as should come in at the San Carlos Reservation. This was objected to by Secretary Teller, of the Interior Department, and the general was summoned to Washington for consultation, which resulted in an arrangement for retaining the Indians on the reservation as prisoners of war under the direct charge of that officer.

The expenditures of the War Department, for the fiscal year ending June 30th, were \$49,791,055, and \$1,668,151 was credited to the subsidized Pacific Railroads, for transportation services rendered the War Department during the fiscal year 1888 and prior years.

The cost of maintaining the Soldiers' Home was \$189,557.63. The number of national cemeteries under the care of the Quartermaster's Department was 88, in which there were 321,369 interments. The total number of deaths reported from the army for the year was 242, of which 162 were from disease, and 80 from wounds, injuries, and accidents. From the casualties of actual warfare there was but one death and nine injuries. The cost of medical and hospital supplies was \$180,139.78. There were nearly 3,600 desertions from the army during the year. At the national armory, Springfield, Mass., 83,621 small-arms were manufactured. Contracts were entered into for making, converting, and testing rifled cannon, but it was impossible to secure those for the larger steel forgings in the United States, and resort was had to the works of Great Britain.

Gen. William T. Sherman retired from the head of the army on November 1st, and was succeeded by Lieut.-Gen. Philip H. Sheridan, Maj.-Gen. J. M. Schofield being transferred to the Division of the Missouri, with headquarters at Chicago.

The Navy.—The naval vessels in commission at the beginning of 1884 were as follow :

North Atlantic Station, Rear-Admiral George H. Cooper. The Tennessee, first rate, 22 guns, Capt. Joseph N. Miller; Vandalia, second rate, 8 guns, Capt. Rush R. Wallace; Alliance, third rate, 6 guns, Commander Allan V. Reed; Galena, third rate, 8 guns, Commander Oliver A. Batchelor; Swatara, third rate, 8 guns, Commander Philip H. Cooper. *South Atlantic Station*, Commodore Thomas S. Phelps. Brooklyn, second rate, 14 guns, Capt. Aaron W. Weaver; Nipsic, third rate, 6 guns, Commander Henry B. Seeley. *European Station*, Rear-Admiral Charles H. Bald-

win. Lancaster, second rate, 10 guns, Capt. Edward E. Potter; Quinnebaug, third rate, 8 guns, Commander Nicol Ludlow; Kear-arge, third rate, 7 guns, Commander William R. Bridgman. *Pacific Station*, Rear-Admiral Aaron K. Hughes. Pensacola, second rate, 23 guns, Capt. Henry Erben; Hartford, second rate, 16 guns, Capt. Charles C. Carpenter; Lockawanna, second rate, 9 guns, Capt. Augustus P. Cooke; Shenandoah, second rate, 9 guns, Capt. Charles S. Norton; Iroquois, third rate, 7 guns, Commander James H. Sands; Adams, third rate, 6 guns, Commander Joseph B. Coghlan; Wachusett, third rate, 7 guns, Commander Alfred T. Mahan; Onward, fourth rate, 8 guns, Lieut.-Commander Francis W. Dickins. *Asiatic Station*, Acting Rear-Admiral John L. Davis. Richmond, second rate, 14 guns, Capt. Joseph S. Kerrett; Trenton, second rate, 10 guns, Capt. Robert L. Phythian; Onispea, third rate, 8 guns, Commander John F. McGlennay; Juniata, third rate, 8 guns, Commander Parnell F. Harrington; Essex, third rate, 6 guns, Commander Alexander H. McCormick; Enterprise, third rate, 6 guns, Commander Albert S. Barker; Monocacy, third rate, 6 guns, Commander Francis J. Higginson; Alert, third rate, 4 guns, Commander Charles J. Barclay; Palos, fourth rate, 6 Lowitzers, Lieut.-Commander George D. B. Glidden. *Training Squadron*, Commodore Stephen B. Luce. Minnesota, first rate, 24 guns, Capt. James H. Gillis, at New York; New Hampshire, first rate, 16 guns, sails, Capt. Edmund O. Matthews, at Newport, R. I.; Jamestown, third rate, sails, 12 guns, Commander Charles V. Gridley, at New York; Sataroga, third rate, 12 guns, Commander William H. Whiting, training-ship, at New York; Portsmouth, third rate, sails, 12 guns, Commander William C. Wise, at Norfolk for repairs. There were also on special service, the Alarm, fourth rate, torpedo-ram, and the Dispatch, fourth rate, at Washington; the Michigan, fourth rate, at Erie, Pa.; the Pinta, fourth rate, on the way to San Francisco; Powhatan, second rate, 14 guns, Capt. Andrew W. Johnson, at Boston; Ranger, third rate, 4 guns, Commander Charles E. Clark, surveying Central American coast; St. Mary's, school-ship, at New York; Tallapoosa, dispatch-vessel, at Norfolk; Yantic, third rate, 4 guns, Commander Frank Wildes, at New York Navy-Yard. The Colorado, first rate, 30 guns, Capt. William A. Kirkland, was a receiving-ship at New York; Franklin, first rate, 26 guns, Capt. Lester A. Beardslee, like service at Norfolk; Wabash, first rate, 26 guns, Captain Fr. M. Bunce, same at Boston; Independence, third rate, at Mare Island; St. Louis, third rate, at League island; Wyandotte, fourth rate, at Washington Navy-Yard. The Speedwell, fourth rate, arrived at Norfolk in January. The iron-clads Ajax, Catskill, Lehigh, Mahopac, and Manhattan were laid up at City Point, Va., in command of Commander D. W. Mullen.

Authority was given by an act of Congress, approved Aug. 5, 1882, to strike from the register of the navy such vessels as should be deemed of no further service to the Government. Under this authority 47 vessels were so stricken from the register. An act approved March 8, 1883, authorized the Secretary of the Navy to dispose of such of these vessels as might be deemed expedient, by sale in accordance with sealed proposals. A circular was issued June 21st, inviting such proposals for the purchase of 24 of these vessels, their names, location, and appraised value being as follow :

The Congress, \$25,400; Guard, \$2,800; Kansas, \$8,100; and Sabine, \$10,400, at Portsmouth, N. H. Iowa, \$44,600; Niagara, \$29,000; and Ohio, \$15,700, at Boston. Blue Light, \$500; and Florida, \$64,400, at New London, Conn. New Orleans, \$200 (on the stocks), at Sackett's Harbor, N. Y. Susquehanna, \$9,000, at New York. Burlington, \$3,000; Glance,

\$400; Supply, \$1,200; Sorrel, \$200; and Dictator, \$33,800, at League island, Pa. Frolic, \$8,600; and Balfie, \$2,600, at Washington. Worcester, \$25,400; Shawmut, \$5,300; and Savannah, \$10,600, at Norfolk. Roanoke, \$37,200, at Chester. Pawnee, \$5,600; and Sea-weed, \$500, at Port Royal, S. C.

Proposals were received until September 24th, and the vessels were awarded to the highest responsible bidders. The aggregate amount realized was \$384,758. Condemned stores and supplies were also sold to the amount of \$185,000. The other vessels stricken from the register were not considered of sufficient value to be sold, and were condemned to be broken up on the stocks.

The Advisory Board appointed to consider the needs of the United States Navy, recommended the gradual substitution of new steel vessels for all the old type of wooden vessels. It fixed the standard for the navy at 70 vessels, 43 for service at sea, and 27 to be held in reserve, and recommended that they be built at the rate of seven a year. Under authority of the acts of Aug. 5, 1882, and March 8, 1883, proposals were invited for the construction of three cruisers, one dispatch-boat, and three double-turreted monitors. The cruisers were to be of steel, and were intended to equal anything afloat in speed and efficiency. The Chicago was to be of 4,500 tons, and the Boston and Atlantic of 2,500 tons each. The contract for the three cruisers and the dispatch-boat Dolphin was awarded to John Roach, of Chester, Pa., the aggregate of his bids being \$2,440,000, and less on each vessel than those of any other bidder. The three monitors, Puritan, Amphitrite, and Terror, were launched on the Delaware before the close of the year, and a similar one, the Monadnock, was launched in California. The contracts for the engines and fittings of the monitors require their completion by July 15, 1884, and the cruisers must be finished during that year.

The Advisory Board recommend the immediate construction of three more large cruisers, together with two gunboats of 1,500 tons, and two of 750 tons, at an estimated cost of \$4,283,000. They also recommend one steel ram, one cruising torpedo-boat, and two harbor torpedo-boats.

A commission was appointed to examine the navy-yards, with a view to determining whether any of them should be dispensed with, and what should be done to put the others in a better state of efficiency. A report was made to the Secretary of the Navy in December.

The commissioners recommended the retention of the Mare Island Navy-Yard, as it was the only one on the Pacific coast. Of that at Portsmouth, N. H., they reported that it affords ample depth of water, is rarely obstructed by ice, is in a region where skilled labor can always be obtained, has a healthful climate, is susceptible of defense, and has excellent plant for the construction and repair of wooden ships. In view of these advantages they did

not recommend the sale of this yard. They did not think it advisable to sell the navy-yard at Boston, of which they said: "Its geographical position, excellent plant, fine dry-dock and buildings, and adaptability to further improvements, give it too much value to be relinquished. Sooner or later defensive works for the protection of the city of Boston must be constructed, when the yard will be safe from attack." The discontinuance of the yard at New London, Conn., was recommended, and the use of the site for a Naval Asylum was suggested. The commissioners then set forth and considered the advantages and disadvantages of the Brooklyn Navy-Yard, and expressed the opinion that it should not be sold. They recommended, however, the sale of a portion of land, comprising about fifty-eight acres, lying to the eastward of Marine Barracks, and including a part or the whole of the hospital-grounds. The commissioners next review the situation, plant, and capability of defense of the League Island Navy-Yard, and say: "Your commissioners do not recommend the sale of this yard. Of all the places on the Atlantic seaboard the Delaware is the best for iron-ship building, and on the Delaware League island has been selected by several boards as the site for a navy-yard." The commission advised against the abandonment of the naval station at Sackett's Harbor, N. Y. The recommendations with regard to the other navy-yards were as follow: *Washington Navy-Yard*.—The sale of this yard is not recommended. *Pensacola Navy-Yard*.—The commissioners do not recommend the sale of this yard, as it is the only one on the Gulf. *Norfolk Navy-Yard*.—The commissioners do not recommend the sale of this yard, because the advantages it undoubtedly possesses far outweigh its deficiencies. *Key West Naval Station*.—The commissioners do not recommend the sale of this station, believing that, in any maritime war, Key West must be retained at whatever cost.

The New London Navy-Yard has been already abandoned, and that at Pensacola closed.

The Post-Office.—The revenues of the Post-Office Department for the fiscal year ending June 30th were \$45,508,692, and the expenses \$42,816,700. There was an increase of 8.6 per cent. in the receipts over those of the previous year. The estimated receipts for the year ending in 1885 are \$47,104,078; expenditures, \$50,062,189. The anticipated deficiency is due to the reduction of letter-postage from three to two cents per half-ounce, which went into effect October 1st (see page 185, *et seq.*). The number of post-offices increased during the fiscal year from 46,231 to 47,863, and the number of employes in the department, from 65,777 to 69,020. The free-delivery system was in operation in 154 offices, at an annual expense of \$3,173,386. The cost of inland mail transportation for the fiscal year was \$19,234,899, an increase of \$358,847 over that of the previous year. The service on Star-routes, which in 1880 cost

\$7,921,499 for 76,070,995 miles of transportation, was done at a cost of \$4,739,478 for 77,998,782 miles of transportation. At the close of the fiscal year there were 998 railway post-office lines, against 769 the previous year. The miles on which the railroad companies were paid had increased from 100,565 to 109,827, and the service upon the lines was measured by 86,180,480 miles. There were 5,927 money-order offices, at which the aggregate issues for the year were \$125,047,238.42; and payments, \$120,407,468.88. The fees amounted to \$1,272,060.60, affording a net profit on the business of \$159,104.84. The total number of letters and packages received at the dead-letter office was 4,440,822, an increase of about 4 per cent. The number of registered letters and parcels was 10,594,716, on which the fees amounted to \$926,549.71. The cost of ocean transportation of mails to foreign ports, under the provision of the law which limits the compensation to the postage on the mails conveyed, was \$316,522.18, of which \$265,621.52 was for transatlantic service.

The Postmaster-General confirmed and renewed the orders of the department, made in 1879, forbidding the delivery of registered letters and the payment of money-orders to the managers of lotteries. Specific instructions were given to the Postmaster of New Orleans not to deliver mail-matter to the Louisiana State Lottery, or to M. A. Dauphin, its president. An arrangement having been made for the payment of money-orders and the delivery of registered letters to the New Orleans National Bank on account of the lottery company, instructions were also issued forbidding delivery and payment to the bank. The result of this action was a suit against the Postmaster-General for \$100,000 damages, brought by the lottery company, and a suit against the Postmaster of New Orleans, brought by the National Bank, for an injunction restraining him from interfering with mail-matter addressed to the bank, and from refusing to pay money-orders payable to it on account of the lottery company. The latter case was decided early in January, 1884, by Judge Pardee, at New Orleans, in favor of the bank, on the technical ground that the Postmaster-General could not revive an order which his predecessor had revoked. He could issue a new order based on evidence presented to himself, but he could not appeal to evidence which his predecessor had discarded, and declare that an order previously revoked was still in force, as he had undertaken to do in this case.

Pensioners.—On June 30th there were 808,658 pensioners on the Government rolls, of whom 198,648 were army invalids, 74,374 army widows, minor children, or dependent relatives, 2,468 navy invalids, 1,907 navy widows, minor children, or dependent relatives, 4,831 survivors of the War of 1812, and 21,836 widows of those who served in the War of 1812. During the year preceding, 88,958 names had been added to the rolls, and 20,997 dropped, leaving a net

increase of 17,961. The average annual value of pensions was \$106.18, and the aggregate annual value of all pensions \$82,245,192.43. The total amount paid for pensions during the fiscal year was \$60,064,009.23, nearly half the sum being for arrears. The total number of claims allowed for pensions since 1861 is 510,958, and the aggregate amount paid during the 23 years is \$621,073,297.60. (See page 248, *et seq.*) A new building for the use of the Pension Bureau is in process of construction at Washington, for which an appropriation of \$400,000 has been made. Many complaints were made of the swindling practices of pension-agents or attorneys during the year, and an effort was made by the Pension Commissioner to break them up. The assistance of the Department of Justice was invoked, and the matter was taken up by the District Attorney of the District of Columbia. In a letter to the Secretary of the Interior announcing his purpose to bring the matter before the Grand Jury, the District Attorney said:

The character of the enormous frauds which are being perpetrated upon applicants for pensions by certain claim agents of Washington will, if the allegations are sustained by the evidence, surprise the public. The devices employed are as numerous as the skill of dishonest men can contrive. Some of the cases before me are heart-rending in their details. Maimed and decrepit soldiers, and the poor widows and helpless orphans of soldiers, pay their pittance of \$1, \$2, \$4, or \$10 to agents who must know their claims are worthless and can never be paid, and these agents merely file a formal application to enable them to collect money from their deluded clients.

Several firms and individuals charged with the fraudulent practices were suspended from the privilege of prosecuting claims before the bureau, and others discontinued business. No new regulations were adopted at the time, but in December a number of the agents accused of deceiving and defrauding their clients were indicted by the Grand Jury of the District.

Revenue Questions.—On June 25th an executive order was issued making important changes in the internal revenue collection districts. The total number of districts was reduced by consolidation from 126 to 82. As a rule, where two districts were consolidated into one, the collector most recently appointed was retained, and the other was dismissed; but in some cases a new collector was appointed.

A question arose in the early part of the year as to the date on which the repeal of the tax on the capital and deposits of banks took effect. The law had required the payment of these taxes half-yearly, on the 1st of January and the 1st of July, and returns of the average amount of capital and of deposits for the six months preceding were required to be made within ten days of those dates. The act of March 5, 1883, simply repealed these provisions, without designating any time for the repeal to take effect. The Attorney-General gave it as his opinion that the tax could not be collected for any part of the half-year already

begun when the repealing act was passed, and this view was acted on.

Miscellaneous.—The amount of public lands disposed of during the last fiscal year was 19,480,032.80 acres, of which 839,285.90 were Indian lands, and 1,999,835.71 acres were grants to railroads. The receipts for lands disposed of were \$11,713,888.70, an increase on 1882 of \$3,319,367.66. There were pre-emption and private entries of 4,465,665.49 acres; timber-culture entries, 8,110,930.23 acres; homestead entries, 56,565 in number, aggregating 8,171,914.88 acres.

The work of educating the Indians was extended during the year, and there is now provision for the education of 11,000.

A noteworthy event of the year was the completion of the main line of the Northern Pacific Railroad in September. The last spike was driven on the 9th of that month, at a point on the Pacific slope of the Rocky mountains 50 miles west of Helena, Montana, and 30 miles west of the Grand Divide, 2,500 miles from the Atlantic Ocean, and 800 miles from the Pacific. The opening of the line from Lake Superior to the Pacific was celebrated by the company, under the direction of its president, Henry Villard, an excursion being made over the whole line in September.

The President made a trip to Florida in the spring, leaving Washington April 5th. On the 30th of July he left the capital for a trip to the West. He attended the opening of the Exposition at Louisville, Ky., on Aug. 1st, and proceeded to the Yellowstone Park by way of Chicago, St. Paul, and the Northern Pacific Railroad. He reached Chicago on his return Sept. 5th, and two days later arrived at the capital, but made no extended stay there until nearly two months later.

UNITED STATES, FINANCES OF THE. The most noteworthy events in the financial history of the year 1883 were the reduction of the internal revenue taxes and the revision of the tariff; the steady decrease of the public debt, involving the redemption of the remainder of the 8½ per cent. bonds and the calling in of a part of the 3 per cents.; the agitation of the question of a further revision of the tariff, in order to bring about the reduction of the revenue which the first revision seems to have failed to produce; and the discussion of plans to avert the contraction of the currency, which it is feared may follow the rapid redemption of the bonds most desirable as a basis for the bank circulation.

Receipts and Expenditures.—The receipts and expenditures of the Government for the calendar years 1882 and 1883 were:

RECEIPTS.	1882.	1883.
Customs.....	\$225,784,180 84	\$203,160,889 56
Internal revenue.....	145,788,158 83	130,789,086 88
Sales of public lands.....	5,718,446 46	10,837,811 87
Tax on national banks.....	9,161,188 28	6,149,968 57
Profits on coinage, etc.....	4,188,296 91	4,449,466 73
Customs fees, fines, etc.....	1,442,076 61	1,251,928 00
Fees—consular, patent, and lands.....	3,985,243 28	3,479,693 29
Repayment of interest by Pacific Railway companies.....	1,461,854 43	1,5 8,108 68
Sinking fund for Pacific Railway companies.....	1,269,850 34	1,284,489 46
Deposits for surveying public lands.....	2,265,308 66	567,518 66
Sales of Government property.....	342,866 55	412,339 86
Sale of Post-Office property in New York city.....		648,094 90
Indian trust funds.....	3,300,308 76	4,633 14
Donations for liquidating the public debt.....	968,391 87	
Japanese indemnity fund.....		1,689,588 99
Immigrant fund.....	88,540 00	247,861 00
Revenues of the District of Columbia.....	1,962,569 08	1,645,578 88
Miscellaneous sources.....	2,326,309 47	2,663,854 98
Total ordinary receipts.....	\$409,446,613 26	\$370,060,552 23
EXPENDITURES.	1882.	1883.
For civil and miscellaneous expenses.....	\$64,871,480 64	\$67,047,450 24
For Indians.....	10,000,099 18	7,148,484 41
For pensions.....	55,368,391 78	67,772,009 72
For the military establishment, including river and harbor improvements and arsenals.....	44,996,957 09	45,578,687 64
For the naval establishment, including vessels, machinery, and improvements at navy-yards.....	15,001,608 90	15,329,466 14
For interest on the public debt.....	68,775,410 95	55,704,556 87
Total ordinary expenditures.....	\$254,009,448 44	\$258,570,604 72
Surplus revenue.....	\$155,437,163 82	\$111,515,947 50

The surplus revenue for 1883, with \$3,624,838.86 drawn from the cash in the treasury, and \$1,500 recovered of moneys heretofore charged off as unavailable, making a total of \$115,141,780.86, was expended in the redemption of the public debt.

There was a falling off of \$44,828,925.45 in 1883, as compared with the preceding calendar year, in the receipts from the following sources:

Customs, \$23,625,791.28; internal revenue, \$14,993,221.99; tax on national banks, \$3,011,274.66; and miscellaneous, \$2,693,637.52. There was an increase of \$4,968,865.41 in the receipts from sales of public lands, making a net decrease of \$39,360,060.04 in the total revenues of the Government.

There was an increase of \$15,488,625.88 in the expenditures during the year on the fol-

lowing accounts: Civil and miscellaneous, including foreign intercourse, public buildings, lighthouses, collection of the revenue, and the District of Columbia, \$2,175,969.60; pensions, \$12,408,117.99; the military establishment, \$576,680.55; and the naval establishment, \$327,857.24. There was a decrease of \$2,856,614.72 in the expenditures on account of the Indians, and of \$8,070,854.88 in the interest on the public debt, making a net increase in the expenditures of \$4,561,156.28, which added to the decrease of \$39,860,060.04 in the receipts, made a falling off of \$48,921,216.32 in the surplus revenues applicable to the redemption of the public debt.

The following table, giving the receipts from customs and internal revenue by quarter-years for 1882 and 1883, shows in a summary form the reduction in the receipts from those sources under the act of March 8, 1883, reducing internal revenue taxes and duties on imports:

CUSTOMS.		
QUARTER.	1882.	1883.
First.....	\$58,585,485 83	\$52,711,024 84
Second.....	58,591,281 79	43,386,053 87
Third.....	64,908,875 71	57,402,975 67
Fourth.....	48,700,588 01	48,660,280 68
Total.....	\$225,786,180 84	\$202,160,389 56

INTERNAL REVENUE.		
QUARTER.	1882.	1883.
First.....	\$30,322,181 98	\$23,863,601 89
Second.....	40,675,693 47	36,411,433 67
Third.....	37,760,504 58	32,662,078 60
Fourth.....	36,994,523 84	31,152,817 67
Total.....	\$145,758,158 82	\$118,089,926 83

The receipts from customs in the last half of 1883 were \$101,063,256.35, as compared with \$113,609,413.72 for the corresponding period in 1882, a reduction of \$12,546,157.37. This falling off was not entirely caused by the reduction in the rates of duty, but was due in part to a decrease in importations. The receipts from internal revenue fell off from \$74,745,328.42 in the last six months of 1882 to \$60,814,896.27 in the last half of 1883, a reduction of \$13,930,432.15.

The reduction in the rates of duty took effect July 1st, but the receipts for the second quarter were somewhat affected by importers postponing until July 1st the withdrawal from warehouse and entry for consumption of goods on which the rates were reduced. The opposite course was pursued with goods on which the rates were increased. The repeal of the internal revenue taxes on bank deposits and capital, and the reduction in the tax on tobacco, cigars, and cigarettes, and in the special taxes on dealers in, and manufacturers of, tobacco, took effect May 1, 1883, and therefore affected the receipts from internal revenue for the second quarter.

The following is a condensed statement of the receipts and expenditures for the fiscal years ending June 30, 1882 and 1883:

RECEIPTS.	1882.	1883.
Customs	\$220,410,780 25	\$214,704,496 98
Internal revenue.....	146,497,595 45	144,721,216 98
Sales of public lands.....	4,758,140 57	7,956,564 49
Tax on national banks.....	8,956,794 45	9,111,006 55
Miscellaneous.....	22,906,959 76	21,798,542 77
Total.....	\$408,525,220 28	\$396,287,261 96

EXPENDITURES.	1882.	1883.
Civil and miscellaneous.....	\$57,319,750 98	\$68,678,022 21
War.....	48,570,494 19	46,911,382 98
Navy.....	15,082,046 26	17,368,487 17
Indians.....	9,786,747 40	7,862,590 84
Pensions.....	61,451,938 95	66,012,573 74
Interest on public debt.....	71,077,906 79	59,160,181 26
Total.....	\$257,961,489 57	\$265,468,187 54
Surplus revenue.....	\$145,563,810 71	\$132,579,444 41

The receipts for the fiscal year 1883 as compared with 1882 increased \$8,202,724.05 in sales of public lands and \$154,214.40 in tax on national banks; and decreased \$5,704,233.32 in customs revenue; \$1,777,226.47 in internal revenue and \$1,118,146.99 in miscellaneous; making \$5,237,668.33 of net decrease. The customs receipts were larger than for any fiscal year except 1872 and 1882, when they were \$216,370,286.77 and \$220,410,780.25, respectively. The receipts from public lands were larger than in any year since 1856, when they were \$8,917,644.93. The net receipts were larger than in any year since 1870, except 1882. The expenditures increased \$11,458,271.23 in civil and miscellaneous; \$5,840,888.74 in the War Department; \$251,890.91 in the Navy Department; and \$4,667,379.69 in pensions; and decreased \$2,374,157.06 in the expenses on account of the Indians and \$11,917,075.54 in interest on the public debt.

The amounts received from the various sources of internal revenue during each of the last two fiscal years were:

SOURCE.	1882.	1883.
Spirits.....	\$60,378,403 16	\$74,806,775 20
Tobacco.....	47,891,988 91	42,104,249 79
Fermented liquors.....	16,158,920 42	16,900,615 81
State banks and bankers.....	5,258,456 47	8,748,994 60
Miscellaneous.....	7,850,497 74	7,430,709 46
Total.....	\$146,528,373 73	\$144,558,344 86

The State of the Treasury.—The condition of the treasury on Dec. 31, 1883, as compared with Dec. 30, 1882, is thus shown:

LIABILITIES.	Dec. 30, 1882.	Dec. 31, 1883.
	Dollars.	Dollars.
Post-Office Department.....	6,991,139 71	8,043,206 87
Disbursing officers.....	25,667,480 00	32,175,823 28
Funds for retirement of bank circulation.....	39,098,798 10	38,514,572 60
Five per cent. redemption fund.	14,668,923 88	14,511,274 73
Other funds held for special purposes.....	6,458,160 50	4,167,461 91
Matured bonds and interest.....	16,982,742 60	17,406,228 96
Gold certificates.....	64,619,840 00	91,081,930 00
Silver certificates.....	72,848,660 00	109,595,611 00
Clearing-House certificates.....	9,568,000 00	14,560,000 00
Balance.....	149,788,040 00	143,173,156 00
Total.....	\$406,218,728 33	\$478,738,810 87

ASSETS.	Dec. 30, 1882.		Dec. 31, 1883.	
	Dollars.		Dollars.	
Gold coin.....	119,528,126	04	132,608,398	46
Gold bullion.....	51,951,432	85	66,408,946	17
Standard silver dollars.....	94,016,542	00	119,449,380	00
Fractional silver coin.....	26,521,692	20	27,224,126	38
Silver bullion.....	4,468,198	10	4,594,373	98
United States notes.....	28,454,394	86	29,644,248	73
Gold certificates.....	25,105,030	00	27,448,780	00
Silver certificates.....	4,405,000	00	18,180,890	00
National-bank notes.....	6,520,020	95	8,955,520	16
U. S. bonds and interest.....	23,721,580	59		
Minor coin and miscellaneous items.....	2,758,256	45	1,020,867	77
Deposits held by national-bank depositaries.....	12,736,099	55	12,813,069	83
Total.....	406,218,738	82	478,782,810	87

The gross amount of gold coin and bullion held by the treasury ran up during the year from \$171,504,568.89 to \$219,014,739.63. The

gold belonging to the Government, after deducting the amount held for the redemption of gold certificates actually outstanding, increased \$23,439,841.24, from \$131,989,758.39 to \$155,429,599.63. The standard silver dollars held ran up from \$94,016,842 to \$119,449,385, or \$25,432,543, while the amount not represented by outstanding silver certificates ran down from \$25,573,182 to \$22,731,664. The gold certificates actually outstanding increased during the year from \$39,514,810 to \$68,585,140, and the outstanding silver certificates from \$68,443,660 to \$98,717,721—adding \$52,344,891 to the paper circulation of the country.

The Public Debt.—The changes during the year 1883 in the character and amount of the public debt are shown below :

CHARACTER OF DEBT.	Dec. 30, 1882.		Dec. 31, 1883.	
	Bonds at 4½ per cent.....	\$250,000,000	00	\$250,000,000
Bonds at 4 per cent.....	738,950,550	00	737,232,750	00
Bonds at 3½ per cent.....	99,226,200	00		
Bonds at 3 per cent.....	269,563,950	00	274,937,250	00
Refunding certificates at 4 per cent.....	404,750	00	315,150	00
Navy pension fund at 3 per cent.....	14,000,000	00	14,000,000	00
Interest accrued on the above loans.....	13,067,188	54	11,881,895	22
Debt on which interest has ceased.....	14,387,015	26	15,188,795	26
Interest on matured debt.....	446,814	88	806,198	73
Demand and legal-tender notes.....	246,740,311	00	246,739,696	00
Clearing-House certificates.....	9,585,000	00	14,560,000	00
Gold certificates.....	64,619,340	00	91,081,920	00
Silver certificates.....	72,843,660	00	109,898,611	00
Fractional currency.....	7,022,074	17	6,989,428	31
Unclaimed Pacific Railway interest.....	5,389	96	4,229	96
Total.....	\$1,920,467,693	81	\$1,878,415,924	48
Less cash in the treasury.....	812,924,016	47	875,374,200	68
Net debt.....	\$1,607,543,676	84	\$1,498,041,723	80
Decrease in the debt during the year.....			\$109,501,958	04

The decrease during the year in the principal of the debt proper, excluding the various classes of certificates for the redemption of which moneys are held in the treasury, was as follows :

Bonds at 4 per cent.....	\$1,817,900	00
Bonds at 3½ per cent.....	107,651,200	00
Bonds at 3 per cent.....	4,913,750	00
Refunding certificates at 4 per cent.....	89,600	00
Demand notes.....	615	00
Fractional currency.....	82,645	86
Debt other than above on which interest has ceased.....	1,181,170	00
Total.....	\$115,141,780	86

Calls were issued during the year for the redemption of \$45,968,700 in 3½ per cent. bonds, and \$40,814,500 in 3 per cent. bonds, a total of \$86,583,200, and "calls" amounting to \$107,716,100 fell due during the year.

The only refunding operation of the Government during the year was the completion of the conversion of the "continued" 3½ per cent. bonds into the 3 per cent. bonds authorized by the act of July 12, 1882. These exchanges continued until July 26, 1883, when a call was issued for the redemption of the remainder of the outstanding 3½ per cents.

The exchanges made prior to Dec. 30, 1882, amounted to.....	\$289,563,950	00
The exchanges during the year were.....	16,017,300	00
Making the total amount of 3 per cents issued in exchange for 3½ per cents.....	\$305,581,250	00
And effecting an annual saving of interest of.....	\$1,527,906	25

The following table shows the changes during the year in the denominations of United States notes outstanding :

DENOMINATION.	Jan. 1, 1882.		Jan. 1, 1884.	
	Dollars.		Dollars.	
One dollar.....	27,726,002	80	30,773,487	80
Two dollars.....	26,012,096	20	27,684,598	20
Five dollars.....	69,020,712	50	78,079,670	00
Ten dollars.....	72,207,501	00	72,528,586	00
Twenty dollars.....	65,760,019	00	55,842,149	00
Fifty dollars.....	28,922,895	00	22,281,045	00
One hundred dollars.....	34,459,490	00	33,022,760	00
Five hundred dollars.....	14,241,500	00	14,524,000	00
One thousand dollars.....	11,657,500	00	14,587,500	00
Five thousand dollars.....	2,390,000	00	240,000	00
Ten thousand dollars.....	210,000	00	110,000	00
Total.....	347,681,016	00	347,681,016	00
Deduct for unknown denominations destroyed.....	1,000,000	00	1,000,000	00
Outstanding.....	346,681,016	00	346,681,016	00

The increase in the notes of the lower denominations, which has been going on since 1879, kept up during the year. The notes of denominations less than \$10 in circulation have increased from about \$90,400,000 to about \$181,500,000 in the last four years and a half.

The National Banks.—During the year ending Nov. 1, 1883, 262 national banks were organized with an aggregate authorized capital

of \$28,654,850. Circulating notes amounting to \$7,909,190 had been issued to these associations to that date. The number of banks organized was greater than in any year since 1865. Of these new banks seven, with \$1,275,000 capital, were organized in the Eastern States; forty, with \$3,115,200 capital, in the Middle States; forty-six, with \$3,798,650 capital, in the Southern States; one hundred and thirty-two, with \$18,295,500 capital, in the Western States; eleven, with \$620,000 capital, in the Pacific States; and twenty-six, with \$1,550,000 capital, in the Territories. Forty banks, with \$7,786,000 capital, and \$4,137,033 circulation, voluntarily ceased doing business during the year; and two banks, with \$250,000 capital, failed. The number of banks in operation Nov. 1, 1883, was 2,522.

The condition of the national banks, Dec. 31, 1883, is shown below, there being 2,529 banks then in operation:

RESOURCES.	
Loans and discounts	\$1,302,223,212 85
Overdrafts	5,263,067 99
United States bonds to secure circulation	845,695,800 00
United States bonds to secure deposits	16,848,000 00
United States bonds on hand	13,160,550 00
Other stocks, bonds, and mortgages	71,609,839 62
Due from approved reserve agents	126,999,906 92
Due from other national banks	77,905,564 28
Due from State banks and bankers	19,899,267 91
Real estate, furniture, and fixtures	49,540,750 85
Current expenses	4,378,218 44
Premiums paid	8,687,534 98
Checks and other cash items	17,684,799 73
Exchanges for Clearing-House	134,402,378 68
Bills of other national banks	23,909,739 00
Fractional currency	427,784 85
Specie, viz:	
Gold coin	\$46,404,661 08
Gold treasury certificates	23,555,260 00
Gold Clearing-House certificates	97,043,000 00
Silver coin	8,470,646 96
Silver treasury certificates	3,503,190 00
Legal-tender notes	114,276,158 04
United States certificates of deposit for legal-tender notes	80,559,796 00
Five per cent. redemption fund with Treasurer U. S.	10,840,000 00
Due from Treasurer other than redemption fund	15,287,684 97
	1,578,258 88
Aggregate	\$2,445,980,917 49
LIABILITIES.	
Capital stock paid in	\$511,897,575 00
Surplus fund	144,900,252 13
Other undivided profits	66,787,945 91
National-bank notes issued	\$809,899,960 00
Amount on hand	4,753,919 00
Amount outstanding	804,944,181 00
State-bank notes outstanding	181,121 00
Dividends unpaid	7,082,682 23
Individual deposits	1,106,458,008 23
United States deposits	10,026,777 79
Deposits of U. S. disbursing officers	3,768,562 04
Due to other national banks	200,867,930 06
Due to State banks and bankers	84,776,421 60
Notes and bills rediscounted	8,248,562 67
Bills payable	4,106,297 78
Aggregate	\$2,445,980,917 49

The paid-in capital stock of the national banks, as shown by their reports, increased during the year from \$484,883,492 to \$511,897,575; their individual deposits from \$1,066,901,719.85 to \$1,106,458,008.23, and their

loans and discounts from \$1,225,889,530.22 to \$1,302,223,212.85.

The circulation shown to be outstanding by the books of the national banks at the close of the year was \$304,944,181 as against \$315,280,925 on Dec. 30, 1882—a decrease of \$10,286,794, caused by banks voluntarily giving up their circulation. The amount outstanding, as shown by the books of the Comptroller of the Currency, including the notes of banks which have failed, gone into voluntary liquidation, or made deposits of lawful money for the retirement of their circulation, decreased during the year from \$362,651.170 to \$350,482,829. The lawful money deposited during the year for the redemption of the circulation of insolvent, liquidating, and reducing banks, amounted to \$23,909,383, and the circulation redeemed out of the money so deposited to \$24,644,924. The total amount deposited on these accounts is \$199,916,952; the total redeemed, \$160,887,444, and the balance on deposit in the treasury, Dec. 31, 1883, \$39,529,508.

The national-bank notes redeemed and assorted by the Treasurer, under the act of June 20, 1874, during the years 1882 and 1883, were disposed of as follows:

	1882.	1883.
Notes fit for circulation, assorted and returned to the banks which issued them	\$4,766,400	\$23,782,100
Notes unfit for circulation, assorted and destroyed	82,402,965	83,256,492
Total	\$87,169,365	\$111,048,592

The increase during the last year was \$23,879,227.

The United States bonds held by the Treasurer of the United States to secure the circulation of national banks, on Dec. 30, 1882, and Dec. 31, 1883, were:

CLASSES OF BONDS.	Dec. 30, 1882.	Dec. 31, 1883.
Six per cents	\$3,526,000	\$3,536,000
Five per cents	15,000	15,000
Four and one half per cents	85,915,500	42,564,000
Four per cents	106,080,600	107,512,300
Three and one half per cents	22,300,850	422,000
Three per cents	192,093,700	193,461,900
Total	\$360,581,650	\$347,583,200

The deposits and withdrawals of United States bonds during the year were:

CLASSES OF BONDS.	Deposited.	Withdrawn.
Six per cents	\$224,000	\$212,000
Five per cents	15,000	15,000
Four and one half per cents	9,668,100	2,944,600
Four per cents	10,070,100	8,688,400
Three and one half per cents	25,324,200	21,876,500
Three per cents	25,324,200	4,456,000
Total	\$45,324,600	\$38,174,500

The act of July 12, 1882, under which the 3 per cent. bonds were issued, provided that

those bonds should be payable at the pleasure of the United States, but should not be called in and paid so long as any bonds of the United States theretofore issued bearing a higher rate of interest than 3 per cent., and redeemable at the pleasure of the United States, should be outstanding and uncalled. The only bonds answering to this description were those which had been continued at $3\frac{1}{2}$ per cent. The "call" for the redemption of the last of these bonds having fallen due Nov. 1, 1883, the 3 per cent. bonds by the terms of the authorizing act became redeemable, and "calls" for the redemption of \$10,000,000 of them were issued before the close of the year, of which \$80,000,000 matured during the year. All other classes of the United States bonds had risen to so high a premium, that the 3 per cent. bonds had been very largely deposited with the Treasurer of the United States by the national banks as security for their circulation, and for public money deposited with them. Of \$374,464,500 in bonds on deposit for these purposes on July 31, 1883, \$210,656,850 was in 3 per cent. bonds, being more than two-thirds of the entire amount outstanding. The calling in of large amounts of these bonds for redemption, and the certainty that under the present revenue laws their rapid retirement will continue, must have a very serious effect on the bank circulation. The premium on the 4 and $4\frac{1}{2}$ per cent. bonds is so great as to reduce the profit on circulation to a very low rate. This fact, added to the general dislike of bankers to carrying a large premium account, has deterred the banks from substituting these bonds for their called 3 per cents. The only alternative is to surrender their circulation by depositing the proceeds of their called bonds in the treasury as a fund for its redemption, and this course is being very generally pursued. Various plans to prevent the contraction of the bank circulation have been suggested. The more important of these are discussed in the annual reports of the Secretary of the Treasury and the Comptroller of the Currency, and in the President's message to Congress.

The Comptroller of the Currency repeats the recommendations made, in his report for 1882. After adverting to the facts mentioned above, he says:

The contraction of the bank circulation may be avoided by reduction of the redundant revenue, and there is no doubt that this is the true policy. . . .

The contraction of the bank circulation may also be avoided by the conversion of the long bonds into three per cents., by offering inducement to the holders of these bonds to exchange them for three per cents. to mature in 1907, the Government paying to the holders thereof a reasonable amount for their difference in value. . . . The premium to be paid to the holders of these long bonds may be considerably reduced by providing that the circulation to be issued upon the proposed bonds when deposited by the national banks as security therefor shall not be subject to the present tax of 1 per cent. per annum, or by postponing the time for their payment. Such legislation would make the new bonds more valuable for this purpose than

for any other, and would be likely to prevent their withdrawal until maturity, if once deposited, and for this reason the bonds would be more desirable as a basis for circulation than any which have heretofore been issued.

The contraction would also be avoided by providing for the removal of the tax on circulation, and the increase of the amount of circulation to be issued to the banks upon the bonds deposited by them. . . .

Other propositions have been suggested in order to postpone or prevent the contraction of national-bank circulation which is now imminent, but the Comptroller considers that, so long as there is a sufficient amount of United States bonds outstanding, legislation should be so shaped as to continue them in use as a basis for national-bank circulation. . . . A law authorizing increase of issue to 90 or 95 per cent. upon the lowest market price during the calendar or fiscal year previous to the deposit, together with the repeal of the tax upon circulation, would result in the deposit of a sufficient amount of the 4 and $4\frac{1}{2}$ per cents. to maintain the circulation at about its present aggregate. . . . If considered desirable, in anticipation of a gradual decline of premium, the proposed law could require the amount of circulation issued to be reduced 1 per cent. yearly, or such per centum that the total amount outstanding could not at any time exceed the value of the bonds on deposit, and the Treasurer also could be authorized to retain the interest upon bonds when necessary upon the request of the Comptroller.

The proposition to convert the long bonds into threes, is more desirable than the proposition to increase the rate of circulation, for the reason already referred to, that the new three per cents. payable in 1891 and 1907 would bear but a comparatively small premium in the market, and that the Government would be enabled to use its surplus revenues to advantage. They would be the only bonds available for circulation, and would not be likely to be withdrawn for sale for the purpose of realizing the market price; and the profit on circulation would be sufficient to induce banks to deposit them whenever additional circulation is required.

The Secretary of the Treasury in his annual report thus discusses the various measures of relief proposed:

The public mind is naturally turned to the inquiry: How shall the national-bank notes be kept in circulation; what shall be taken as a safe foundation therefor, and yet be so low in price as that the banks can afford to buy and deposit; or what can be proposed which will give to the banks safeguard against loss in taking and issuing circulating notes? I am not in favor of anything but the interest-bearing obligations of the United States Government. . . . There are other propositions, the vertebral idea of which is the creation of a new form of public debt. A plausible one is, for the Government to offer a new bond, of its own issue, at low rate of interest, to run a long period, in exchange for its 4 per cents. and $4\frac{1}{2}$ per cents., allowing such a rate of premium upon the latter, but lower than that at present ruling, as would induce the holders to surrender them and take the new; and to make this a security for bank circulation. I doubt not that this is feasible. In that way, a holder of fours or four-and-a-halves could capitalize the premium allowed on his bond, and draw interest at the new rate on that as well as on the principal, whereby there would be an inducement to exchange, rather than to hold, or, in the present difficulty of desirable reinvestment, to sell. . . . Should this project be favorably considered, details can be furnished. Yet I am so averse to recommending the creation of another or a different public debt, that as great as are, in my judgment, the advantages of the national-bank circulation in safety, in uniformity of value everywhere, and in other matters of convenience and confidence, I

look upon such project as a *dernier ressort*. I rather recommend, and so I do, that the internal revenue tax upon circulation be taken off in whole or in part. This is 1 per cent. per annum, and amounts to about three millions and a quarter each year. . . .

I further recommend that this Department be authorized to allow to the banks circulation to the amount of 90 per cent. upon the average market value, for the twelve months prior to the deposit, of the United States bonds deposited on security. Thus a bank would be enabled to obtain circulation upon the premium it paid for bonds, as well as upon the par value of them. . . . For greater caution, there may be fixed a limit of value, above which the valuation of them for adjusting a ratio shall not go. A collateral advantage, not only to the banks but to the community, is that an amount of banking assets laid away in the premium paid for bonds would thereby be released and brought into active use. It is understood, as was before stated, that in business circles United States bonds are taken as a good collateral up to 95 per cent. of their market value at the time. To be sure, there is the right reserved, in case of lowering fluctuation in market value, to demand an increase of security. There should the same power be given to this department, and the difference of 5 per cent. in the business and governmental margin, will counterbalance the nimbleness of the individual creditor, greater than that of the public agent, in looking after change in market value and in calling for further security.

The statements above made show that there is little danger of ultimate loss to the Government or noteholder, upon a circulation based upon the interest-bearing bonds of the United States, though taken as security at a margin coming near to the current market value thereof.

The President's remarks and recommendations upon the subject of the currency are as follows:

If the revenues of the next four years shall be kept substantially commensurate with the expenses, the volume of circulation will not be likely to suffer any material disturbance.

But if, on the other hand, there shall be great delay in reducing taxation, it will become necessary either to substitute some other form of currency in place of the national-bank notes, or to make important changes in the laws by which their circulation is now controlled.

In my judgment the latter course is far preferable. I commend to your attention the very interesting and thoughtful suggestions upon this subject which appear in the Secretary's report.

The objections which he urges against the acceptance of any other securities than the obligations of the Government itself as a foundation for national-bank circulation, seem to me insuperable.

For averting the threatened contraction, two courses have been suggested, either of which is probably feasible. One is the issuance of new bonds, having many years to run, bearing a low rate of interest, and exchangeable upon specified terms for those now outstanding. The other course, which commends itself to my own judgment as the better, is the enactment of a law repealing the tax on circulation and permitting the banks to issue notes for an amount equal to 90 per cent. of the market value instead of as now the face value of their deposited bonds. I agree with the Secretary in the belief that the adoption of this plan would afford the necessary relief.

Bills designed to carry into effect these various suggestions have been introduced into both houses of Congress. The most important of these are the bills of Senator Aldrich and Representative Potter, which provide for

issuing in lieu of the 4 and 4½ per cent. 2½ per cent. bonds, having an equal time to run, paying out of the surplus revenues a premium on the bonds taken up equal to the aggregate present worth of the surrendered interest, computed at 4 per cent., and for reducing the tax on the bank circulation issued on the new bonds from 1 to ½ per cent.; and the bill of Senator McPherson, which provides simply that banks may issue circulation equal in amount to the par value of the bonds which they have deposited as security for their notes. The last-mentioned bill passed the Senate on the 25th of February, 1884, all propositions to make the market value of the bonds in any way the basis of the amount of circulation to be issued to the banks having been voted down.

The Coinage.—The following statement shows the coinage that was executed by the various mints during the fiscal year which ended June 30, 1883:

DENOMINATION.	Pieces.	Value.
GOLD COIN.		
		Dollars.
Double eagles.....	1,876,806	27,226,190 00
Eagles.....	661,179	6,611,790 00
Half-eagles.....	853,072	1,775,800 00
Three dollars.....	1,555	4,665 00
Quarter-eagles.....	4,055	10,137 50
Dollars.....	8,865	8,865 00
Total gold.....	2,407,022	36,196,927 50
SILVER COIN.		
Dollars.....	28,111,119	28,111,119 00
Half-dollars.....	5,519	2,759 50
Quarter-dollars.....	16,519	4,079 75
Dimes.....	7,175,119	717,511 90
Total silver.....	36,808,076	35,653,470 15
MINOR COIN.		
Five cents.....	90,455,488	1,022,774 40
Three cents.....	28,619	858 57
One cent.....	40,467,400	404,674 19
Total minor.....	60,951,506	1,428,297 16
Total coinage.....	98,666,624	66,300,704 81

The deposits of gold coin and bullion were \$46,847,106.05; and of silver, \$36,869,834.65. Including redeposits, the total amount of bullion and coin received and operated upon by the mints and assay-offices was \$87,758,154.05, of which \$49,145,559.16 was gold, and \$38,612,594.89 silver. Of the bullion deposited, \$32,481,642.38 in gold bullion, and \$32,758,487.68 in silver bullion, were of domestic production. The total amount of silver dollars coined under the act of Feb. 28, 1878, to June 30, 1883, was \$147,255,899, and to Dec. 31, 1883, \$161,425,119. Of the latter amount, \$119,449,885 was held by the treasury, and \$41,975,734 was in circulation.

Exports and Imports.—The following table shows the value of the exports and imports for the fiscal year 1883 in the commerce of the United States with the principal foreign countries, in the order of magnitude:

Order.	COUNTRIES.	Exports.	Imports.
1	United Kingdom (England, Scotland, and Ireland).....	\$495,494,174	\$188,622,619
2	France.....	55,682,222	97,989,164
3	Germany.....	66,162,929	57,377,738
4	West Indies.....	22,800,882	68,800,091
5	British North American Provinces.....	46,580,258	44,740,876
6	Brazil.....	9,262,094	44,483,459
7	Belgium.....	27,778,975	28,161,200
8	Netherlands.....	18,919,888	19,238,738
9	Mexico.....	16,587,620	8,177,123
10	Spain.....	16,981,287	7,794,845
11	China.....	4,080,222	90,141,831
12	Italy.....	10,818,538	11,909,658
13	Russia.....	19,141,751	2,599,995
14	British East Indies.....	2,185,904	19,467,800
15	Japan.....	3,870,434	15,093,890
16	British possessions in Australasia.....	3,795,656	4,021,895
17	United States of Colombia.....	6,865,971	5,171,465
18	Hawaiian Islands.....	3,776,065	8,288,461
19	Spanish possessions other than Cuba and Porto Rico.....	824,474	10,617,568
20	Argentine Republic.....	3,543,196	6,192,111
21	Gulana.....	2,388,588	6,487,909
22	Venezuela.....	2,408,705	5,901,724
23	Central American states.....	2,008,467	5,121,815
24	Portugal.....	5,435,087	1,093,476
25	Hong-Kong.....	3,777,759	1,918,894
26	Uruguay.....	1,452,818	3,990,110
27	Dutch East Indies.....	2,407,181	2,645,917
28	Denmark.....	802,876	302,886
29	Austria.....	1,779,904	2,934,923
30	Sweden and Norway.....	2,324,548	1,881,171
31	British possessions in Africa and adjacent islands.....	2,498,069	1,840,020
32	Turkey.....	1,369,708	2,168,967
33	Chili.....	2,860,496	485,584
34	Peru.....	498,394	2,926,918
35	All other countries.....	4,412,305	7,618,108
	Total.....	\$923,899,402	\$723,180,914

The dutiable merchandise imported increased from \$514,060,567 in the fiscal year 1882 to \$515,676,196 in 1883, or \$1,615,629, and the merchandise free of duty imported decreased from \$210,579,007 in 1882 to \$207,504,718 in 1883, or \$3,074,289, making a net falling off of \$1,458,660 in importations from \$724,639,574 in 1882 to \$723,180,914 in 1883. The exports of domestic merchandise increased from \$733,239,732 to \$804,223,632, and of foreign merchandise from \$17,802,525 to \$19,615,770, making the total exports in 1883, \$823,839,402, as against \$750,542,257 in 1882, and increasing the total foreign commerce from \$1,475,181,831 in 1882 to \$1,547,020,316 in 1883.

The value of the exports of products of agriculture, manufacture, mining, forestry, and the fisheries, during the last fiscal year, is shown below:

PRODUCTS OF—	Value.	Per cent. of total.
Agriculture.....	\$619,269,449	77.00
Manufactures.....	111,890,001	18.91
Mining (including mineral oils).....	51,444,857	6.40
Forestry.....	9,976,148	1.24
The fisheries.....	6,276,875	.78
All other commodities.....	5,866,807	.87
Total.....	\$804,223,632	100.00

The value of the exports of agricultural products increased from \$552,219,819 in 1882 to \$619,269,449 in 1883, and of manufactures from \$103,132,481 to \$111,890,001.

The following table shows by articles the value of the merchandise imported into the United States during the fiscal years 1882 and 1883, in the order of their magnitude in 1883:

Order.	ARTICLES.	Value, 1882.	Value, 1883.
1	Sugar and molasses.....	\$99,826,895	\$100,469,092
2	Wool, and manufactures of.....	65,324,258	43,457,670
3	Silk, and manufactures of.....	50,807,616	51,875,959
4	Chemicals, drugs, dyes, and medicines.....	48,126,285	42,957,860
5	Coffee.....	42,050,518	45,041,609
6	Iron and steel, and manufactures of.....	40,796,007	51,877,388
7	Cotton, and manufactures of.....	37,664,321	35,141,136
8	Hides and skins, other than furs.....	27,640,080	27,841,126
9	Tin, and manufactures of.....	29,917,587	21,611,178
10	Flax, and manufactures of.....	19,787,542	19,328,198
11	Fruits of all kinds, including nuts.....	19,818,041	18,518,606
12	Tea.....	17,802,849	19,892,109
13	India-rubber and gutta percha, and manufactures of.....	15,844,802	14,568,927
14	Breadstuffs, and other farinaceous food.....	15,880,605	19,295,094
15	Wood, and manufactures of.....	14,867,578	14,592,864
16	Leather, and manufactures of.....	13,104,415	12,145,761
17	Jute, and other grasses, and manufactures of.....	12,606,512	10,872,332
18	Wines, spirits, and cordials.....	12,308,907	9,849,588
19	Tobacco, and manufactures of.....	11,771,596	9,847,769
20	Provisions, including eggs, fish, and potatoes.....	10,658,278	12,661,855
21	Earthen, stone, and china-ware.....	8,620,627	6,979,669
22	Fancy goods, perfumery, and cosmetics.....	8,268,471	10,212,101
23	Furs, dressed and undressed.....	7,959,759	5,080,970
24	Glass and glassware.....	7,762,043	6,694,371
25	Precious stones.....	7,692,365	8,444,625
26	Articles, the produce or manufacture of the United States, brought back.....	6,514,999	5,796,898
27	Paper materials.....	6,589,376	6,014,138
28	Hemp, and manufactures of.....	5,118,508	6,292,810
29	Buttons and button materials.....	4,228,161	3,940,863
30	Animals, living.....	4,042,967	4,812,989
31	Books and other publications.....	3,651,290	3,578,924
32	Straw and palm-leaf, manufactures of.....	3,565,187	3,449,041
33	Paintings, engravings, and statuary.....	3,408,874	3,086,822
34	Metals, and manufactures of, not elsewhere specified.....	3,297,972	3,026,581
35	Oils of all kinds.....	2,736,758	3,042,996
36	Watches, and watch materials.....	2,522,111	2,554,420
37	Hair, and manufactures of.....	2,496,699	1,902,508
38	Spices.....	2,474,088	2,608,281
39	Household and personal effects, old and in use.....	2,315,858	2,429,022
40	Coal, bituminous.....	2,063,972	2,189,298
41	Paper, and manufactures of, not elsewhere specified.....	1,958,118	2,094,280
42	Seeds.....	1,702,345	2,846,892
43	Salt.....	1,674,808	1,678,515
44	Musical instruments.....	1,652,528	1,580,144
45	Paints, of all kinds.....	1,386,629	1,218,112
46	Bristles.....	1,228,548	1,082,855
47	Cocoa, not including chocolate.....	1,213,871	1,528,998
48	Clothing (except of silk and hosiery, etc., of cotton and wool).....	1,182,255	1,365,405
49	Malt-liquors.....	1,122,010	970,326
50	Stone, and manufactures of.....	1,011,968	980,071
51	Cork bark and wood, unmanufactured.....	988,985	1,124,216
52	Manufactures of gold and silver, not elsewhere specified.....	912,625	712,781
53	Guano, except from bonded islands.....	575,742	656,622

63	All other dutiable articles.....	7,094,744 05	2,140,995 39	30-13
	Total dutiable.....	\$493,916,838 81	\$209,650,698 56	42-45
	Total free of duty.....	206,913,289 47
	Additional and discriminating duty.....	977,594 51
	Total.....	\$700,829,673 28	\$210,637,293 87	29-92

Of the total duties collected, 22-02 per cent. was collected on sugar, molasses, and confec-

tionery; 15-42 per cent. on wool and manufactures thereof; 9-37 per cent. on manufactures

* The value of the merchandise entered for consumption amounted to \$700,829,673, and embraced both goods entered for immediate consumption on arrival in the United States, and goods withdrawn from warehouse during the year for consumption. The value of the imports into the United

States amounted to \$723,130,914, embracing goods entered for immediate consumption on arrival, goods entered for transportation to interior ports without appraisement, and goods entered for warehousing awaiting the payment of duties.

of silk; 5.84 per cent. on manufactures of cotton; 3.91 per cent. on iron and manufactures thereof; 4 per cent. on steel and its manufactures; and 3.62 per cent. on flax and its manufactures. The aggregate amount of duties collected on these seven commodities and classes of commodities was \$184,557,435.69, and 64.18 per cent. of the total amount.

The free goods entered in the fiscal year 1882 amounted to \$210,721,981, and the dutiable goods to \$505,491,967, making the total entries \$716,213,948, as compared with \$700,829,673 in 1883.

The following statement shows the amount of duties collected during each of the last two fiscal years on the six commodities yielding the greatest revenue:

ARTICLE.	1882.	1883.
Sugar, molasses, and confectionery.....	\$49,193,912	\$46,172,379
Wool and its manufactures.....	29,263,016	32,890,308

Manufactures of cotton.....	12,237,108	12,294,371
Wines and spirits.....	6,771,488	8,741,958

The Reduction of Taxation.—The report of the Tariff Commission, appointed under the act of May 15, 1882, with a schedule of the changes in the rates of duties recommended by it, was submitted to Congress Dec. 4, 1882, the beginning of the second session of the Forty-seventh Congress. It was referred to the Committee on Finance in the Senate and to the Committee on Ways and Means in the House. The commission said that the average reduction in duties at which it had aimed was not less than 20 per cent., and that in its opinion it would reach 25 per cent. The Ways and Means Committee, on Jan. 16, 1883, reported a "bill to impose duties on imports and for other purposes." This measure was based on the commission's schedule of proposed duties, but made a less reduction in the duties on many important articles than that recommended by the commission. A computation made on the importations for the fiscal year ending June 30, 1882, showed that the reduction proposed by the committee would amount to \$20,855,799.08 on \$215,395,628.58 duties collected in that year, or less than 10 per cent. This bill was, however, never completed by the House. Its consideration was abandoned on the 17th of February, the House having, after a long and tedious discussion, passed upon only 45 of its 140 pages. In the mean time the same question was being considered by the Senate. A bill to reduce internal revenue taxation had passed the House at the preceding session, and was still pending in the Senate. This bill, having been recommitted to the Committee on Finance, was reported on January 4th with an amendment embracing an entire revision of the tariff, based like the House bill on the commission's report. The reduction of revenue which the bill would cause was estimated by

the chairman of the committee (Senator Morrill) at \$45,049,000 in the duties on imports and \$34,790,324 on internal revenue, including national-bank taxes, making a total reduction of \$79,839,324.* This bill, having been exhaustively debated, item by item, by the Senate, and amended in many particulars, passed that body on the 20th of February, and was sent to the House. The House adopted an amendment of its rules, declaring that it should be in order at any time during the remainder of the session by a majority vote to suspend the rules, declare a disagreement with the Senate amendments, and ask for a committee of conference on the bill; and that, if that motion should fail, the bill should remain on the Speaker's table, unaffected by the failure. This proposition was opposed by a minority of the House, who desired an opportunity to vote in favor of concurring in the Senate amendments, which provided for a greater reduction of duties than the unfinished House bill, and the Democratic members generally refrained from voting on it. The House non-concurred in the Senate amendments, and asked for a committee of conference on the 27th of February. The conference committee having submitted its report, the bill passed both houses and became a law, March 3, 1883. The changes made by the conference committee in the bill as it passed the Senate were mainly in the direction of an increase of rates. Among other changes the duty on iron-ore was raised from 50 cents a ton, as proposed by the Senate, to 75 cents; on pig-iron and wrought and cast scrap-iron, from \$6.50 a ton of 2,240 pounds to $\frac{1}{5}$ of a cent a pound; on steel railway bars, weighing more than 25 pounds to the yard, from $\frac{1}{10}$ of a cent a pound to \$17 a ton; on iron or steel T-rails, weighing not over 25 pounds to the yard, from $\frac{1}{10}$ to $\frac{1}{5}$ of a cent a pound; on steel not otherwise provided for, from 30 to 45 per cent. ad valorem; on manufactures of metal not otherwise provided for, from 35 to 45 per cent.; on sugar above No. 18 and not above No. 16, Dutch standard, from $2\frac{1}{2}$ to $2\frac{3}{4}$ cents a pound; on books, pamphlets, etc., from 15 to 25 per cent.; on salt in packages, from 10 to 12 cents a hundred pounds; and on salt in bulk, from 6 to 8 cents a hundred pounds. Books in a foreign language were taken from the free list and made subject to 25 per cent. duty. The chairman of the Senate Finance Committee, in explaining the conference report, said that if there should be no greater importations than in the year before, the aggregate reduction of taxation under the bill would probably be more than \$75,000,000 a year. The report of the House conference committee said that the bill provided for an estimated aggregate reduction of \$67,000,000, of which it was estimated that about \$35,000,000 would

* The bill was afterward so amended, by the cutting down of the tax on tobacco in all its forms to one half the former rate, as to increase the reduction in internal revenue taxes, including the tax on the capital and deposits of national banks, to about \$48,000,000.

result from the changes made in the internal revenue laws, and \$80,000,000 to \$82,000,000 from the cutting down of customs duties.

The act as passed repealed the tax on the capital and deposits of banks, bankers, and national banking associations; the stamp-tax on checks and drafts; and the tax on matches, perfumery, medicinal preparations, cosmetics, and the like. The tax on dealers in and manufacturers of tobacco was largely reduced; the tax on tobacco was reduced from 16 to 8 cents a pound; on cigars from \$6 to \$3 a thousand; and on cigarettes from \$1.75 to 50 cents a thousand. The following are some of the more important changes in the rates of duty made by the bill:

The duty on sugar was reduced from rates ranging from $2\frac{3}{4}$ to 5 cents a pound, to rates ranging from $1\frac{1}{2}$ to $3\frac{1}{2}$ cents a pound; on clothing and combing-wools valued at less than 80 cents a pound, from 10 cents a pound and 11 per cent. ad valorem to 10 cents a pound; on carpet-wools, from 3 and 6 cents for different grades to $2\frac{1}{2}$ and 5 cents; on woolen cloths and other manufactures of wool not otherwise provided for, from 50 cents a pound and 85 per cent. ad valorem to 35 cents a pound and 85 and 40 per cent. ad valorem; on ready-made clothing and wearing-apparel of wool and worsted, from 50 cents a pound and 40 per cent. to 40 cents a pound and 85 per cent.; on silk goods, from 60 to 50 per cent. ad valorem; on hats of vegetable material, etc., from 40 to 30 per cent., and on such hat materials from 80 to 20 per cent.; on barley, from 15 to 10 cents a bushel; on cleaned rice, from $2\frac{1}{2}$ to $2\frac{1}{4}$ cents a pound; on bleached cottons (except jeans, etc.), from $5\frac{1}{2}$ to $3\frac{1}{2}$, 4, and 5 cents a square yard according to grade; on finer and lighter cotton prints (except jeans, etc.), from $5\frac{1}{2}$ cents a square yard and 20 per cent. ad valorem to 5 and 6 cents a yard and to 40 per cent. ad valorem for the higher-priced goods; on linens, etc., valued at above 30 cents a yard, from 40 to 35 per cent.; on raisins, from $2\frac{1}{2}$ to 2 cents a pound; on articles of fur, from 35 to 30 per cent.; on jute-butts, from \$6 to \$5 a ton; flat bar-iron of medium dimensions, from 1 to $\frac{1}{4}$ of a cent a pound; on pig-iron, from \$7 a ton to $\frac{1}{4}$ of a cent a pound; on wrought scrap-iron, from \$8 a ton to $\frac{1}{4}$ of a cent a pound; on steel railway-bars or rails, from $1\frac{1}{2}$ cent a pound to \$17 a ton; on calfskins, from 25 to 20 per cent.; on musical instruments, from 30 to 25 per cent.; on molasses not above 56 degrees, from $6\frac{1}{2}$ to 4 cents a gallon; on tin plates or sheets,terne plates and tagger's tin, from $1\frac{1}{2}$ cent to 1 cent a pound; on woolen dress goods valued at not exceeding 20 cents a yard, from 6 cents a yard and 35 per cent., to 5 cents a yard and 35 per cent.; valued at above 20 cents, from 8 cents and 40 per cent. to 7 cents and 40 per cent. Considerable reductions were also made in the chemical schedule, and some additions were made to the free list. The duty on cot-

ton laces, embroideries, etc., was advanced from 35 to 40 per cent.; on decorated china and porcelain-ware, etc., from 50 to 60 per cent.; on similar ware not decorated, from 45 to 55 per cent.; on all earthen, stone, and crockery ware, white, glazed or edged, not otherwise provided for, from 40 to 55 per cent.; on the finer grades of cotton hosiery, from 35 to 40 per cent.; on opium, from \$6 to \$10 a pound; on champagne and other sparkling wines, from \$6 to \$7 a dozen quarts; on still wines, from 40 to 50 cents a gallon; and on paintings and statuary, from 10 to 30 per cent. ad valorem.

The act also repealed the provisions of law requiring the cost of transportation from the place of production to the vessel in which shipment is to be made to the United States, the value of the covering of the goods, commissions, brokerage, export duty, and other charges for putting up, preparing, and packing for transportation or shipment, to be added to the dutiable value of merchandise. It further provided for the assessment of duties on all sugars not above No. 13 of the Dutch standard in color, according to their saccharine strength as shown by the polariscope test, instead of according to their color by the Dutch standard, as formerly.

The reduction of revenue thus far has not come up to the estimates of either the Tariff Commission or the committees of conference.

The reduction in the receipts from customs for the six months ending Dec. 31, 1888, as compared with the corresponding six months of 1882, was \$12,546,167.87; in internal revenue, \$13,930,432.15; and in the tax on capital and deposits of national banks, \$2,971,146.28. The total decrease is at the rate of \$58,895,471.60 a year.

The Commissioner of Internal Revenue, in his annual report for 1888, estimated that the aggregate amount of the reductions in internal revenue taxes would not be less than \$37,000,000, but that the revenue from distilled spirits would be so increased as to make the aggregate receipts for the fiscal year at least \$120,000, or about \$24,700,000 less than for the fiscal year 1883. The actual receipts from internal revenue for the six months ending Dec. 31, 1888, were \$60,814,896.27, or at the rate of \$121,629,792.54 a year, conforming very nearly to the commissioner's estimate.

The reduction in the receipts from duties on imports for the six months is at the rate of but little more than \$25,000,000, or less than 12 per cent. of the receipts for the fiscal year 1883. A computation made by the Bureau of Statistics shows that for the three months ending Sept. 30, 1888, as compared with the corresponding three months of 1882, the reduction in the average ad-valorem rates of duty on dutiable merchandise was only 2.12 per cent.—from 44.20 to 42.08 per cent. The reduction in the average ad-valorem rate of duty on both free and dutiable merchandise was from 32.12

to 80.48 per cent., or 1.64 per cent. The entries of dutiable merchandise for consumption fell off during the same period from \$144,012,-940 to \$133,330,848.

The failure of the tariff revision to produce the expected reduction of revenue, and the plans for a further reduction which had been brought forward, were discussed by the President in his message, and by the Secretary of the Treasury in his report. The following extracts summarize the Secretary's views:

The question recurs: Shall we now seek again for that reduction which was not attained, and is it now advisable to attempt a reduction of the revenues for future years to arise from duties on imports? There was general agreement that a substantial reduction of the tariff should be made. The estimates of the Tariff Commission and of the Senate committee show what was the contemplated reduction. The actual results so far obtained indicate that the reduction labored for has not been effected by the new tariff act. It is to be considered, too, that the failure is not to be charged to the increase of importations keeping up the amount of customs revenue. The statistics of our foreign commerce show that there has not been an increase chargeable therewith. As to the principles of reduction, if a revision be practicable, there seems to be little disagreement. The reduction should be made on articles entering into general consumption as necessities—as sugar, molasses, and the like—rather than upon luxuries; upon raw materials, rather than manufactured, with due regard to the fostering of domestic industries and occupations, especially those not fully established. In the report of this department last year, the reduction as applied to the principal classes of dutiable articles was considered somewhat in detail, and, adhering to the views there expressed, a repetition of them is unnecessary.

It may not be deemed expedient so soon to make again a revision of the tariff to effect a reduction. And there are considerations which are apt upon this head. The new tariff act went into operation, in all its parts, on the 1st day of July, 1883. There has gone by since then but little over one third of a fiscal year. It is a short time in which to learn with accuracy how so important and wide-reaching a law as that, touching all the business and industrial interests of the country, will permanently affect the revenues. It is known that in some respects the first effects of it may not be relied upon as stable. . . . On the whole, then, this department does not recommend an immediate revision of the tariff act. It adheres, however, to its conviction that ultimately the just and expedient method of relief from taxation, and of limiting the revenues to the needs of an economical Government, must be found in a reduction of the duties on imports. . . . Propositions are made to repeal the whole system of internal revenue. As to this, I repeat my remark of last year: "I see no public sentiment or political action, indicating a desire on the part of tax-paying citizens to strike out this class of taxes."

The President said:

There are cogent reasons, however, why the national indebtedness should not be thus rapidly extinguished. Chief among them is the fact that only by excessive taxation is such rapidly attainable. In a communication to the Congress at its last session I recommended that all excise taxes be abolished except those relating to distilled spirits, and that substantial reductions be also made in the revenues from customs. A statute has since been enacted by which the annual tax and tariff receipts of the Government have been cut down to the extent of at least fifty or sixty millions of dollars. While I have no doubt that still further reductions may be wisely made, I do not advise the adoption at this session of any measures for

large diminution of the national revenues. The results of the legislation of the last session of the Congress have not as yet become sufficiently apparent to justify any radical revision or sweeping modifications of existing law.

Notwithstanding these recommendations, a bill was reported by the Committee on Ways and Means of the House, March 11, 1884, placing wood, sawed or squared timber, sawed lumber, salt, and coal, on the free list, and making a "horizontal" reduction of 20 per cent. in the duties on all other articles, excepting wines, liquors, silks, precious stones, and certain kinds of glass, with the proviso that the rates shall in no case be reduced below those of the "Morrill" tariff of 1861, and that no article in the cotton schedule shall pay more than 40 per cent. ad valorem, no article in the woolen schedule more than 60 per cent., and no article in the metal schedule more than 50 per cent.

UNITED STATES FISH COMMISSION. The United States Fish Commission was established in 1871 by a joint congressional resolution, which became a law on February 9th. The text of the resolution is as follows:

Whereas it is ascertained that the most valuable food-fishes of the coast and the lakes of the United States are rapidly diminishing in number, to the public injury, and so as materially to affect the interests of trade and commerce: Therefore,

Be it resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the President be, and he hereby is, authorized and required to appoint, by and with the advice and consent of the Senate, from among the civil officers or employés of the Government, one person of proved scientific and practical acquaintance with the fishes of the coast, to be commissioner of fish and fisheries, to serve without additional salary.

Sec. 2. *And be it further resolved,* That it shall be the duty of said commissioner to prosecute investigations and inquiries on the subject, with the view of ascertaining whether any and what diminution in the number of the food-fishes of the coast and the lakes of the United States has taken place; and, if so, to what causes the same is due; and also, whether any and what protective, prohibitory, or precautionary measures should be adopted in the premises; and to report upon the same to Congress.

Sec. 3. *And be it further resolved,* That the heads of the Executive Departments be, and they are hereby, directed to cause to be rendered all necessary and practicable aid to the said commissioner in the prosecution of the investigations and inquiries aforesaid.

Sec. 4. *And be it further resolved,* That it shall be lawful for said commissioner to take, or cause to be taken, at all times, in the waters of the sea-coast of the United States, where the tide ebbs and flows, and also in the waters of the lakes, such fish or specimens thereof as may in his judgment, from time to time, be needful or proper for the conduct of his duties as aforesaid, any law, custom, or usage of any State to the contrary notwithstanding.

For fifteen or twenty years public interest in the fisheries had been constantly increasing, this being largely stimulated by the action of the French Government in fostering the still infant art of fish-culture, which, although discovered before the middle of the previous century in Germany, and never really abandoned in Europe, was not deemed worthy of government aid until the successes of Rémy and

Géhin were popularized by the brilliant genius of M. Coste, under whose directorship the first public fish-cultural station was planted at Hünigues, in Alsace. The publications and experiments of Fry, Garlick, Ainsworth, Atwood, Stone, Green, Slack, Lyman, and others, and especially the reproduction in this country of the admirable essay of M. Jules Haime on pisciculture, awakened everywhere

to be appointed should be a civil officer of the Government, of proved scientific and practical acquaintance with the fishes of the coast, to serve without additional salary. The choice was thus practically limited to a single man. Prof. Spencer F. Baird, at that time the Assistant Secretary (since 1878 Secretary) of the Smithsonian Institution, was appointed, and entered at once upon his duties.

ROOM IN HATCHERY AT HÜNIGUES, ALSACE.

a sense of the fact that our coast-waters were being rapidly depopulated, and of the counter-fact that their restoration was practicable through reparative and protective measures. Massachusetts appointed a Commissioner of Fisheries in 1865, and prior to 1870 her example was followed by several other States. The establishment in 1871 of the American Fish-Culturists' Association (now the American Fish-Cultural Association) marks the period at which interest in the fish and fisheries had become sufficiently great and wide-spread to warrant the founding of a national association.

The immediate cause of the establishment of the Government Commission was a difference of opinion between the governments of Massachusetts and Rhode Island as to the extent of the destructive effects of the trap and pound fisheries of southern New England, and the proper function of legislation in their regulation.

In 1872, at the instance of the American Fish-Culturists' Association, the commission was charged with the task of restoring fish to depleted waters, and its field of labor was thereby greatly extended.

The resolution establishing the office of Commissioner of Fisheries required that the person

to be appointed should be a civil officer of the Government, of proved scientific and practical acquaintance with the fishes of the coast, to serve without additional salary. The choice was thus practically limited to a single man. Prof. Spencer F. Baird, at that time the Assistant Secretary (since 1878 Secretary) of the Smithsonian Institution, was appointed, and entered at once upon his duties.

It is generally admitted that the success of the Fish Commission work has been due entirely to the wise and energetic management of the commissioner, whose position, as an officer of the Smithsonian Institution, enabled him to secure at once the aid of a body of trained specialists. The principal activity of the commissioner has been directed to the wholesale replenishment of our depleted waters. The success of fish-culture is well recognized in the United States, and it was especially gratifying to its advocates that in 1880 the grand prize of the International Fisheries Exhibition at Berlin was awarded to Prof. Baird as the "first fish-culturist of the world," and that in 1883, at London, many gold and silver medals were awarded to the Fish Commission, in addition to others distributed among its officers and employés.

Division of the Work.—The work of the commission is naturally divided into three sections:

1. The systematic investigation of the waters of the United States, and the biological and physical problems which they present. Scientific research of this character is based upon a liberal and philosophical interpretation of the law. In making his original plans, the commissioner insisted that to study only the food-

fishes would be of little importance, and that conclusions, to be really useful, must rest upon a broad foundation of purely scientific investigation. The life-history of species of economic value should, of course, be understood from beginning to end, but no less requisite is it to know the histories of the animals and plants upon which they feed or upon which their food is nourished; to know the histories of their enemies and friends, and the friends and foes of their enemies and friends, as well as the currents, temperatures, and other physical phenomena of the waters in relation to migration, reproduction, and growth.

2. The investigation of the methods of fisheries, past and present, and the statistics of production and commerce of fishery products. Fishery methods and apparatus must be examined and compared with those of other lands, that the use of those which threaten the destruction of useful species may be discouraged, and that those which are inadequate may be replaced by others more serviceable. Statistics of industry and trade must be secured for the use of Congress in making treaties or imposing tariffs, also to show to producers the best markets, and to consumers from what source and wherewithal their needs may be supplied.

neighbors. The propagation of fish is at present by far the most extensive branch of the work of the commission, both in respect to the number of men employed and the money appropriated.

Since the oldest and most important fishery industries center in New England, the coast of this district must be the seat of the most active operations in marine research. For thirteen years the commissioner, with a party of specialists, has devoted the summer season to work at various stations along the coast from North Carolina to Nova Scotia. The routine of work is usually as follows: A suitable place having been selected, a temporary laboratory is fitted up with the necessary appliances for collection and study. In this are placed tables, often at headquarters as many as thirty, each occupied by an investigator, either an officer of the commission or a volunteer.

The work at a summer station includes all the various forms of activity known to naturalists: collecting along the shore, seining upon the beaches, setting traps for animals not otherwise to be obtained, and scraping with dredge and trawl the bottom of the sea at depths as great as can be reached by a steamer in a trip of several days. In the laboratory are carried

SECTION OF STEAMER FISH-HAWK.

3. The introduction and multiplication of useful food-fishes throughout the country, especially in waters under the jurisdiction of the General Government, or those common to several States, none of which would undertake to make expenditures for the benefit of their

on the usual structural and systematic studies, the preparation of museum specimens and of reports.

The permanent headquarters are now at Wood's Holl, Mass., where wharves are being built for the accommodation of the fleet of the

commission, and houses for use for scientific and fish-cultural laboratories, and where the propagation of sea-fishes will be continued on a larger scale than has hitherto been attempted.

For several years, steamers were lent for the summer work by the Secretary of the Navy, the Coast Survey, and the Revenue Service. In 1880, however, a steamer of 450 tons, the *Fish-Hawk*, was built for the commission. This being needed for fish-hatching purposes, another large steamer, of 1,000 tons, the *Albatross*, was built and put into commission in 1883. At the time of writing this article the *Albatross* is detailed in the service of the Hydrographic Office of the Navy, making a series of deep-sea soundings in the Caribbean Sea. Her trial-trips have been very fruitful in results to science.

Hundreds and even thousands of specimens of a single species are often obtained in a summer's work. After those for the National Museum have been selected, a great number of duplicates remain. These are identified, labeled, and made into sets for exchange with other museums, and for distribution to schools and small museums. Several specialists are employed solely in making up these sets and in gathering material required for their completion. Within three years fifty sets of fishes in alcohol, including at least 10,000 specimens, have been sent out, and fifty sets of invertebrates, embracing 175 species and 250,000 specimens. One hundred smaller sets of representative forms intended for educational purposes, to be given to schools and academies, are being prepared.

The arrangement of the invertebrate duplicates is in the charge of Richard Rathbun; of the fishes, in that of Dr. Tarleton H. Bean. Facilities have also been given to many institutions for making collections on their own behalf.

In addition to what has been done at the summer station, and by the vessels of the commission at sea, investigations have been carried on by smaller parties everywhere in our coast and interior waters.

The co-operation of the Superintendent of the Life-saving Station has been of great importance in obtaining knowledge of the occurrence of unusual marine animals on remote portions of the coast. The patrols of the life-saving stations visit nearly every part of the Atlantic coast daily, and report by telegraph to Washington the stranding of whales, porpoises, sharks, etc. When the importance of the case seems to warrant it, naturalists are sent to study and bring in these animals for preservation.

One important feature in this work has been the preparation of life-histories of the principal fishes, great quantities of material having been accumulated relating to almost every species. A portion of this has been published, including biographical monographs on the blue-

fish, the scup, the menhaden, the salmon, the white-fish, the shad, the mackerel, and the sword-fish; and others are being printed.

The temperature of the water, in its relation to the movements of fish, has from the first received special attention. Observations are made regularly during the summer work, and at the various hatching-stations. At the instance of the commissioner, an extensive series of observations has for several years been made under the direction of the Chief Signal-Officer of the Army, at lighthouses, light-ships, life-saving and signal stations, carefully chosen, along the whole coast. One practical result of the study of these observations has been the demonstration of the cause of the failure of the menhaden-fisheries on the coast of Maine in 1879—a failure on account of which nearly two thousand persons were thrown out of employment; another, the explanation of the variations in the shad-fisheries of the Potomac from 1881 to 1883.

A series of analyses is being made by Prof. W. O. Atwater to determine the chemical composition and nutritive value of fish as compared with other articles of food. (See page 342 of this volume.)

In connection with the work of fish-culture much attention has been paid to embryology. The breeding-times and habits of nearly all of our fishes, and their relations to water-temperatures, have been studied. The embryological history of a number of species, such as the cod, shad, alewife, salmon, smelt, Spanish mackerel, striped bass, white perch, and the oyster, have been obtained under the auspices of the commission, by Messrs. Ryder, Brooks, and others.

The second branch of the work, the investigation of the statistics and history of the fisheries, has perhaps assumed greater proportions than was at first contemplated. It has been said above that one of the immediate causes of the establishment of the commission was the dissension between the line and net fishermen of southern New England with reference to laws for the protection of the deteriorating fisheries of that region. The first work of Prof. Baird, as commissioner, was to investigate the causes of this alleged deterioration, and the report of that year's work included much statistical material. In the same year a zoological and statistical survey of the great lakes was accomplished, and various circulars were sent out in contemplation of the preparation of monographic reports upon special branches of the fisheries.

In 1877 the commissioner and his staff were summoned to Halifax, to serve as witnesses and experts before the Halifax Fishery Commission, then charged with the settlement of the amount of compensation to be paid by the United States for the privilege of participating in the fisheries of the provinces. The information available concerning the fisheries was found to be so slight and imperfect that a plan

for systematic investigation of the subject was arranged and partially undertaken. This work was carried on for two seasons, receiving some financial aid from the Department of State. In 1879 an arrangement was made with the Superintendent of the Tenth Census, who agreed to bear a part of the expense of carrying out the scheme in full. Thirty trained experts were for several months engaged in the

gathering of material for a statistical report on the history and present state of the fisheries of the United States. This has since been finished, and is now being published. Many of the statistical results, being the first which have ever been prepared as the outcome of an examination of the fishery centers by experienced statisticians, are shown in the accompanying table.

STATISTICS OF THE FISHERIES OF THE UNITED STATES IN 1890.
Prepared for the Tenth Census, under the direction of G. Brown Goode.

The third and last department of the work is that of propagation. The various States have numerous laws for the protection of fish and fishermen, generally worse than useless, though there are many definitions of close-time, which appear to be beneficial. To enforce these laws would, however, render necessary a large number of fish-wardens. The policy of the United States Commissioner has been, to carry out the idea that it is better to expend a small amount of public money in making fish so plenty that they can be caught without restriction, to serve as cheap food for the people at large, rather than to employ a much larger amount in preventing the people from catching the few that still remain after generations of improvidence.

The propagation-work has increased in importance from year to year, as may be seen by the constant increase in the amount of the annual appropriation. A review of the results of the labors of the commission, in increasing

the food-supply of the country, may be found in the annual reports; the rude appliances of fish-culture in use ten years ago have given way to scientifically devised apparatus, by which millions of eggs are hatched where thousands were, and the demonstration of the possibility of stocking rivers and lakes to any desired extent has been greatly strengthened.

This work, from 1871 to 1877, was most efficiently directed by James W. Milner, whose untimely death was caused by his over-strenuous labors in fish-culture. It is now under the immediate direction of Maj. T. B. Ferguson, Assistant Commissioner, by whom much of the machinery for fish-culture on a gigantic scale, by the aid of steam, was devised, and Col. Marshall McDonald, Chief of the Division of Propagation. The work of the commission in fish-culture has been that of stimulation and co-operation, which has been extended to the State Fish Commissions and to fish-culturists in every part of the world.

Hatching-Stations.—As the operations of the commission have increased, and the propagation of additional species has been undertaken, it has been found desirable to increase the number of hatching-stations. These are of two kinds, known as collecting and distributing stations. The former are near the spawning-grounds of those species for which they are especially intended. The eggs are secured at these stations, and enough having been reserved to stock the waters of that region, the remainder are sent to distributing stations, to be hatched and shipped to the waters for which they are intended. The following is a list of the hatching-stations operated by the United States Fish Commission in 1888, for which we are indebted to R. Edward Earll:

1. Grand Lake Stream, Me., station for collecting eggs of the Schoodic salmon (*Salmo salar*, subsp. *sabago*).
2. Bucksport, Me., station for collecting and hatch-

ing and the gold-fish (*Carassius auratus*), the golden ide (*Idus melanotus*, var. *auratus*), and the tench (*Tinca vulgaris*).

(b.) Arsenal Ponds. Ponds for the propagation of carp (*Cyprinus carpio*).

(c.) Navy-Yard. Station for collecting and hatching eggs of the shad (*Clupea sapidissima*).

(d.) Central hatching-station. A station fully equipped for scientific experiments connected with the propagation of fishes. The station is also provided with apparatus for hatching the eggs of all the more important species, including light, heavy, and ad-heive eggs. It is the principal distributing station of the Fish Commission, for both eggs and young fish, to all portions of the United States.

7. Wytheville, Va. A station for hatching eggs of brook-trout (*Salvelinus fontinalis*) and California trout (*Salmo irideus*).

8. Saint Jerome's Creek, Point Lookout, Md. A station for the artificial propagation of the oyster (*Ostrea Virginiana*), the Spanish mackerel (*Scomberomorus maculatus*), and the banded porgy (*Chatodipterus faber*).

9. Avoca, N. C. A station on Albemarle Sound, at the junction of Roanoke and Chowan rivers, for col-

PROCESS OF TAKING SALMON-EGGS.

lecting, hatching, and distributing eggs of the shad (*Clupea sapidissima*), alewife (*Clupea vernalis* and *caestivalis*), and striped bass (*Morone saxatilis*).

10. Northville, Mich. A hatching-station for the development and distribution of eggs of the white-fish (*Coregonus clupeiformis*). This station is also provided with tanks and ponds for the spawning, hatching, and rearing of brook-trout (*Salvelinus fontinalis*) and California trout (*Salmo irideus*).

11. Alpena, Mich. A station for the collection and development of the eggs of the white-fish (*Coregonus clupeiformis*).

12. Baird, Cal. (a.) Salmon-station. A station on the McCloud river for the development and distribution of eggs of the California salmon (*Oncorhynchus chouicha*).

(b.) Trout-ponds. A station near Baird, for collecting, developing, and distributing eggs of the California trout (*Salmo irideus*).

13. Baird, Cal. (a.) Salmon-station. A station on the McCloud river for the development and distribution of eggs of the California salmon (*Oncorhynchus chouicha*).

(b.) Trout-ponds. A station near Baird, for collecting, developing, and distributing eggs of the California trout (*Salmo irideus*).

14. Baird, Cal. (a.) Salmon-station. A station on the McCloud river for the development and distribution of eggs of the California salmon (*Oncorhynchus chouicha*).

(b.) Trout-ponds. A station near Baird, for collecting, developing, and distributing eggs of the California trout (*Salmo irideus*).

15. Baird, Cal. (a.) Salmon-station. A station on the McCloud river for the development and distribution of eggs of the California salmon (*Oncorhynchus chouicha*).

18. Clackamas river, Oregon. A station on Columbia river for collecting and hatching eggs of the California salmon (*Oncorhynchus chouscha*).

ment of the money appropriated for the work of the United States Fish Commission, from its organization in 1871 to the fiscal year 1882-'83, is from the records of the commissioner :

Appropriations and Prizes.—The following state-

APPROPRIATIONS FOR THE UNITED STATES FISH COMMISSION.

YEAR.	Inquiry.	Propagation.	Hatcheries and ponds.	Steamers, car, etc.	Illustration.	Total.
1871-'72	\$2,500					\$2,500 00
1872-'73	5,000	\$25,000			\$500	30,500 00
1873-'74	5,000	22,500			1,000	28,500 00
1874-'75	5,000	17,500			1,000	23,500 00
1875-'76	5,000	65,000			1,000	71,000 00
1876-'77	5,000	30,045			1,000	36,045 00
1877-'78		67,500	\$2,200 00		1,000	70,700 00
1878-'79		70,000	5,000 00		1,000	76,000 00
1879-'80	8,500	90,000	5,000 00	\$27,500	1,000	157,000 00
1880-'81	2,500	82,000	17,000 00	15,000	1,000	121,500 00
1881-'82	2,500	130,000	20,001 45	174,200*	1,000	328,710 45
1882-'83	2,500	115,000	30,000 00	72,500†	1,000	229,000 00
	\$47,500	\$727,545	\$79,201 45	\$326,200	\$10,500	\$1,190,955 45

* Of this amount, \$1,500 was for rent of offices.

† Including \$3,000 for a car and \$1,500 for office-rent.

Besides the above, Congress appropriated \$20,000 to enable the United States to participate in the International Fisheries Exhibition at Berlin in 1880, and \$50,000 for our representation at the International Exhibition in London in 1883, and in both cases the highest honors were awarded to the exhibits of the United States. An inspection of the table will show that more than one third of all the money disbursed by the United States Fish Commission has been devoted to permanent improvements.

At the International Fisheries Exhibition held in London from May 10 to November 1, 1883, which was the largest representation ever made of a single industry, the United States received more than one fifth of all the awards given to foreign and colonial government displays. A much larger proportion of gold med-

als fell to our lot than was received by any other country. This result was due mainly to the participation of the United States Fish Commission and National Museum, whose exhibits called forth the highest praise and were awarded the most substantial honors. The table in the preceding column, showing the relative standing of the competing countries, is based upon the official list of jury awards.

Publications of the Commission.—The regular official publications of the Fish Commission are in two octavo series: 1. The report of the commissioner, issued in yearly parts. Each volume consists of two sections, the first being the report proper, containing the commissioner's summary of the year's work, together with his recommendations, practical suggestions, and the announcement of his plans for future activity. This is issued in advance of the full volume, which usually appears about two years later than its date. The second part, five or six times as large as the first, contains the contributions and reports of the officers and collaborators of the commission, together with translations of similar writings by European authorities.

The "Bulletin of the Fish Commission" was established in 1881. One volume of about 500 pages is distributed each year.

The commission is now publishing a report in quarto volumes, with illustrations, upon the fishery industries of the United States, the result in part of the alliance with the Census Office in 1880. The statistical results of this alliance will occupy a volume of the census series. A special bulletin was published in 1880, consisting of the original edition of Elliott's monograph on the seal islands of Alaska. Much material collected by and relating to the work of the commission is published in the Proceedings and Bulletins of the United States National Museum. Bulletin 27, now (April, 1884) going through the press, is a catalogue of the collections exhibited by the United States at the London Fisheries Exhibition, and contains a

summary of the present condition of the various departments of work. The publications of the commission up to 1884 include 9,296 pages, besides 2,397 pages of the Bulletins of the National Museum. In Mr. C. W. Smiley's list, which extended to August, 1883, 1,077 papers are mentioned, and this list does not include nearly all of those pertaining to the work which have been printed in outside journals.

History of Yearly Work.—The following summary of the annual work of the commission is expanded from a paper entitled "The First Decade of the United States Fish Commission," read before the American Association for the Advancement of Science, at its Boston meeting in 1880:

1871.—The commissioner, with a party of zoölogists, established the first summer-station at Wood's Holl, Mass., other assistants being engaged in a similar work at Cape Hatteras and on the great lakes. He also personally investigated the alleged decrease of the fisheries in southern New England, taking the testimony of numerous witnesses.

1872.—The summer-station was at Eastport, Me., particular attention being paid to the herring-fisheries. The survey of the great lakes was continued. Dredging, under the direction of Prof. Packard, was begun on the off-shore banks. At the instance of the American Fish-cultural Association, Congress requested the commissioner to take charge of the work of multiplying valuable food-fishes throughout the country. Work was begun on the shad, salmon, and white-fish, and the eggs of the European salmon were imported.

1873.—The summer-headquarters were fixed at Portland, Me. The opportunities for research were greatly increased by the aid of the Secretary of the Navy, who granted the use of an eighty-ton steamer. Explorations in the outer waters, between Mount Desert and Cape Cod, were carried on in the United States coast-surveying steamer *Bache*. Operations in fish-culture were carried on upon an extensive scale.

1874-'75.—In 1874 the zoölogical work centered at Noank, Conn. The attempt was made to introduce shad into Europe. In 1875 the station was for a second time at Wood's Holl, where a permanent sea-side laboratory, with aquaria, was now established. The number of investigations this year was about twenty. The increase in the propagation-work was proportionately much larger.

1876.—The commissioner was unable to take the field for fishery investigations, having been instructed to exhibit, in behalf of the commission, the fishes and useful invertebrates, as well as the methods of fish-culture and the American fisheries, at the Philadelphia International Exhibition. Much, however, was accomplished by single investigators in various localities. The propagation-work continued. This year the first carp were introduced from Germany.

1877.—The field of investigation was resumed at Salem, Mass., and later at Halifax, N. S. A larger steamer, of 300 tons, made deep-sea research possible. The commissioner and his staff served as experts before the Halifax Fishery Commission. The propagating work was on the increase, and the Government carp-ponds were established in Washington.

1878-'79.—In 1878 the summer-station was at Gloucester, Mass., in 1879 at Provincetown. These centers of the fishing interests were selected that more attention might be devoted to studying the history, statistics, and methods of the sea-fisheries; a plan for the systematic investigation which seemed yearly more necessary, in view of the discussions between the Governments of the United States and Great Britain. In 1879 a combination was formed with the

Superintendent of the Tenth Census, by which the commissioner was enabled to carry forward this branch of the work more rapidly. Specialists were dispatched to all parts of the country, to study the biological, statistical, and practical aspects of the fisheries. In 1878 the breeding of cod and haddock was accomplished at Gloucester. In 1879 the propagation of the oyster was accomplished, by co-operation with the Maryland Commission, under the direction of Maj. Ferguson, and the distribution of the carp throughout the country was begun.

1880.—The summer-station was at Newport, R. I. The *Fish-Hawk*, a steamer of 484 tons, constructed expressly for the work, lies at the wharf, now equipped for scientific research, later to be employed in the propagation of sea-fish, such as the cod and the mackerel. Over fifty investigators are in the field in the service of the commission. The season was opened by the participation of the commission in the International Exhibition at Berlin. The first-honor prize, the gift of the Emperor of Germany, was awarded to Prof. Baird.

1881.—The summer-station was at Wood's Holl, Mass. The investigation of the area of distribution and the economical qualities of the *tile-fish* was one of the practical results of the work of the season. A railway-car was constructed for the express purpose of distributing fish, and an entire change was effected in the methods of fish transportation. Experiments were made in hatching cod and Spanish mackerel, and in the retardation of the development of shad-eggs. Land was acquired at Wood's Holl for a permanent station for hatching cod and other sea-fishes and for general biological research. The publication of the "Bulletin" of the Fish Commission was begun. Fishery bulletins were issued relative to the fisheries of the Pacific Coast States, the Great Lakes, Maine, Virginia, and the oyster industry.

1882.—The summer-station was again at Wood's Holl, and the explorations of the *Fish-Hawk* from this place were conducted mainly in the Gulf Stream, resulting in the acquisition of much valuable material and information. Congress appropriated money for building a pier in Great Harbor, Wood's Holl. The Armory station in Washington was fitted up for hatching enormous quantities of eggs of food-fishes, and railroad-tracks were laid within the inclosure, so that the Fish Commission cars can be loaded from the doors of the hatchery. The white-fish hatchery at Alpena, Mich., was established; \$50,000 was appropriated for the representation of the United States at the London Fisheries Exhibition, under the charge of the United States Fish Commission. The station for rearing California trout at Wytheville, Va., and that for propagation of the oyster at St. Jerome's creek, Md., passed into the possession of the Government. The fishery census of 1880 was practically completed. Congress ordered the publication of a report on American fish and fisheries. The disappearance of the tile-fish in the North Atlantic was demonstrated. The steamer *Albatross* was completed.

1883.—Wood's Holl, Mass., was again occupied as a summer-station, and the deep-sea investigations of the *Albatross*, begun off Chesapeake Bay early in the season, were continued from this place with surprising results. The United States exhibit in London in charge of the commissioner, Mr. G. Brown Goode, was successful over all other competitors, owing mainly to the participation of the Fish Commission and the National Museum. The feasibility of the artificial rearing of oysters was shown by Mr. J. A. Ryder, Embryologist of the Commission, at Chincoteague Bay, Md. The distribution of fishes was enormously increased.

Work at the Principal Stations.—The hatchery at Northville, Mich., was established in 1874 by N. W. Clark. In 1880 it passed into the control of the United States Fish Commission, and continued under the care of Frank N.

Clark, who has developed it into one of the most important stations in the world for the treatment of eggs of the *Salmonida*—brook-trout, lake-trout, white-fish, rainbow-trout, and California salmon. It is especially active in the propagation of the white-fish, having, from 1874 to 1893, distributed more than 20,000,000 eggs and upward of 80,000,000 of the young of that species. Up to 1879 Mr. Clark hatched 1,600,000 California salmon; since that date the hatching of that species at Northville has been discontinued. Of the landlocked salmon, 104,000 have been hatched; 633,000 eggs and 310,000 young of the brook-trout have been shipped; 250,000 eggs and 127,000 young of the lake-trout were distributed; 247,500 rainbow-trout were hatched and sent out. White-fish have been

that, without public fish-culture, half of them would be obliged to abandon their calling.

NORTHVILLE FISH-HATCHERY.

planted mostly in the great lakes, but large numbers of them have been forwarded, also, to Michigan, California, Nevada, Maine, Iowa, Minnesota, Kentucky, Pennsylvania, Connecticut, New Jersey, Maryland, New Hampshire, North Carolina, Germany, New Zealand, and France. Lake-trout eggs have been successfully sent to Germany and France. Brook-trout eggs have safely reached Germany, France, England, and South America. By the aid of refrigeration for retarding the development of white-fish eggs, Mr. Clark expects to be able to hatch 500,000,000 annually at Northville. The Northville hatchery has a series of natural and artificial ponds, in which are kept brook-trout, rainbow-trout, landlocked salmon, and lake-trout for breeding. In the autumn of 1882 the United States Commissioner built a second white-fish hatchery at Alpena, Mich., and placed it under the charge of Mr. Clark.

The hatchery for Atlantic salmon at Bucksport, Maine, is under the direction of Charles G. Atkins. The supply of living salmon is obtained early in June, from weirs in the Penobscot river, on the shores of Verona island. The fish are transported by water in tanks made out of fishing-boats, for more than seven miles, to the ponds adjoining the hatchery, and are there confined until the breeding-season, which is late in October and in November. At the proper time the eggs and milt are taken, and the salmon are released. Since 1871 nearly 15,000,000 eggs have been distributed. The Schoodic salmon-breeding establishment, on Grand Lake stream, Maine, is also in charge

ATLANTIC SALMON (*Salmo salar*).

This establishment has a nominal capacity for 100,000,000 eggs. In the two hatcheries at Alpena and Northville there were produced, in the winter of 1883-'84, over 100,000,000 eggs of the white-fish, and the total number of young fish to be placed in the great lakes in 1884, by these and the various State hatcheries, will exceed 225,000,000. The fishermen of the great lakes admit

of Mr. Atkins. Here the fish are intercepted in the stream on their way to their spawning-grounds, and led into inclosures of netting, where they are kept until the supply of eggs is obtained. After that the breeders are carried back into the lake and liberated. From 1875 to 1883 this establishment distributed 10,249,500 eggs of the landlocked salmon, and

they have been successfully introduced into lakes of Maine, New York, and other States, and even as far south as North Carolina.

The California salmon-hatchery, on the McCloud river, was established in 1872, under the direction of Livingston Stone, who has made

CALIFORNIA SALMON (*Oncorhynchus tshawytscha*).

it the greatest station of the kind in existence. The native salmon are stopped in their ascent of the river by a dam near the hatchery, and they congregate in vast numbers. In 1877 Mr. Stone built the salmon-hatching establishment on Clackamas river, Oregon, and in 1879 the McCloud river trout-pond station was established for treating eggs of the rainbow-trout. Mr. Stone has summarized the work of the salmon station in the following words: "In the eleven years since the salmon-breeding station has been in operation, 67,000,000 eggs have been taken, most of which have been distributed in the various States of the Union. Several millions, however, have been sent to foreign countries, including Germany, France,

Great Britain, Denmark, Russia, Belgium, Holland, Canada, New Zealand, Australia, and the Sandwich Islands. About 15,000,000 have been hatched at the station, and the young fish placed in the McCloud and other tributaries of the Sacramento river. So great have been the benefits of this restocking of the Sacramento, that the statistics of the salmon-fisheries on the Sacramento show that the annual salmon-catch of the river has increased 5,000,000 pounds during the past few years."

The principal shad-hatching station of the United States is in the Armory, Army Square,

Washington. This building now has all the modern appliances for the work, and can accommodate an unlimited number of eggs. Nearly 50,000,000 were received there in one year. Eggs are received from small camps from fifty to one hundred miles away, and the fry are shipped in cars constructed for fish-transportation. The station near Havre de Grace, in the lower waters of the Susquehanna river, is also important, and it has the advantage of a large pool in which shad may be confined until their eggs are ripe. Fully 70,000,000 eggs of shad have been hatched in a single year at all the stations of the commission. Instances of great improvement might be cited in connection with nearly every shad-river in the

CENTRAL STATION, ARMORY, WASHINGTON, D. C.

United States. In the Potomac alone the annual yield has been increased from 668,000 pounds in 1877 to an average of more than 1,600,000 pounds in recent years.

The carp-ponds for the rearing of German carp, in Washington, have been furnishing these fish to the people since 1879. Into every State and Territory of the Union the carp have gone to increase the stock of domesticated fishes, and in suitable waters their growth has been remarkable. A scale-carp sent to Texas when four inches long increased to twenty and one half inches in eleven months, and gained about four and one half pounds. Large carp not infrequently are sold in the market of Washington, which have sprung from escaped fishes in the Potomac, and they are readily sold notwithstanding the high price (twenty-five cents a pound). It is estimated that fully 80,000 ponds have been supplied with carp. In 1882 alone, carp were distributed from the Fish Commission ponds in Washington, in lots of twenty, to 10,000 applicants, representing every State and Territory of the Union, at an average distance of more than 900 miles; the total mileage of the shipments being about 9,000,000, and the actual distance traversed by the transportation-cars, 34,000 miles.

UNITED STATES, FISH-CULTURE IN THE. Modern fish-culture involves the artificial taking and impregnation of eggs; providing for them shelter and a suitable supply of water during the period of incubation; the protection and feeding of the young; the transportation of the fry and eggs; facilitating the ascent of fish in streams to their natural spawning-beds by removing obstructions and impurities in the waters; legislating against over-fishing, injurious fishing, and otherwise destroying industries; the artificial rearing of inferior species as food for such as have commercial value; the introduction into new waters of species which are known to be important elsewhere; and the systematic study of all the natural con-

ditions which affect the movements and sometimes the existence of aquatic animals.

The mere hatching and depositing of fish-eggs artificially is but a small portion of the art of fish-culture as now practiced. It is quite as important to remove obstructions and impurities from streams, to prevent improper fishing, and to study the capabilities of waters for supporting life as it is to stock them with an abundance of fry. The word "fish-culture" no longer serves to convey the meaning intended; the term "aquiculture" is more nearly adequate to the purpose, for we have to deal with all the objects of fishery—whales, seals, crustaceans, oysters, corals, sponges, and every form of aquatic life. Fish-culture is simply one of a series of means to an end. Wherever unfavorable conditions exist, it must be combined with systematic investigation of the natural causes affecting the movements of aquatic animals, and with such intervention against obstacles of all sorts as will insure the full benefits of artificial introduction of economic species.

All civilized countries now make provision for the artificial rearing of fish. The necessity for this is more particularly felt in the rivers, where the direct consequences of man's mistakes are more apparent than in the open sea. If the salmon and the shad, which periodically ascend our streams for the purpose of reproduction, met with no serious obstructions upon their way, perhaps the necessity of fish-culture would not be so clearly seen. In July, 1879, at Bainbridge, Lancaster co., Pa., I saw great shoals of shad-fry, the individuals of which averaged more than two and a half inches in length, lining the east shore of the river. At the same time the Pennsylvania Canal, which there follows the course of the river, contained similar swarms of the young fishes. At various times during different years this phenomenon has occurred, yet at no time since those observations has there been a good catch of

SMITH'S SALMON-LADDER, 1840.—Gradient one in seven. Inlet 2 feet wide and 2 feet deep, opening between each pool 1 foot wide. Water in each pool 15 inches deep.

adult shad above the obstruction at Columbia, except when there was a break in the dam. We believe, therefore, that the removal of obstructions in streams would restore them to something like their primitive value for the fisheries. The obstructions, however, exist, and the additional element of pollution enters into the problem. We can not depend upon Nature to restore the fisheries; we must supply the deficiency by artificial hatching, and facilitate the ascent of fish in streams by introducing fish-ways. As early as 1830, Mr. Smith, of Deanston, Scotland, invented a salmon-ladder, of which an illustration is given with this article. The object of a fish-way is secured by retarding the velocity of the descending water sufficiently to allow the fish to overcome the current and pass beyond the obstruction. Numerous devices have been employed for the purpose, but seldom with good results, and a successful fish-way is scarcely demonstrated as yet. The best general paper on the subject was written by Mr. C. G. Atkins for Part II of the U. S. Fish Commissioner's Report. In the "Transactions of the American Fish-cultural Association for 1888" will be found a valuable paper by Col. M. McDonald, on "A New System of Fish-way Building." The McDonald

McDONALD FISH-WAY, ON THE RAPEHANNOCK.

fish-way is the most promising of recent inventions, and there is good reason for believing that it will solve the problem of impassable dams. In this the water is made to act against gravity by the employment of a series of bent tubes, which receive the water at one end and discharge it with greatly diminished force at the other.

Artificial breeding has numerous advantages over natural breeding. A much greater percentage of eggs can be fertilized and developed by artificial methods; the eggs after impregnation are protected from the inroads of their numerous natural enemies, and the young fishes are nourished until they have gained a degree of strength which they would scarcely acquire under natural conditions, and are deposited where the chances for their survival are the best. In a state of nature only a very

small percentage of the eggs deposited ultimately produce adult fishes. The ova are preyed upon by hosts of insects, by swarms of cyprinoids, cottoids, and siluroids, which infest all streams, and by numerous aquatic birds and mammals; they are liable to be smothered in a mass of mud, or washed away by floods, or crushed by floating timber; they are subject, also, to fatalities which do not beset them in the nurseries provided by man. In the wild state the larger fishes destroy the smaller, but in rearing-ponds such losses are entirely preventable, only fishes of equal size being kept in the same inclosure, and they receive a sufficient supply of food.

The early history of fish-culture relates to the utilization of ova naturally impregnated, and the rearing of fish which have been transferred from their natural habitat to an artificial one, in which they are fattened and prepared for market. This form of fish-culture is believed to have begun in China at a remote date, and the literature of this portion of the subject is considerable. The Chinese have extensively collected, transported, and developed eggs laid under natural conditions, and they continue to do so. The art of fish-culture, as practiced to-day, dates from about the middle of the eighteenth century. Stephen Ludwig Jacobi, a lieutenant of militia of Lippe-Detmold, in Westphalia, was, at that date, acquainted with the idea of artificially impregnating the eggs of fish and thereby restocking ponds and streams. Jacobi's discovery was not made public till 1763, when he embodied in a letter, which is printed in the "Hanover Magazine," the results of his experiments. As early as 1758 he had corresponded upon the subject with Buffon. A Latin translation of Jacobi's essay was made by Count de Goldstein, and his memoir was published in French in 1770, in an abridgment of the "Memoirs of the Berlin Academy. In 1773 Duhamel du Monceau published a translation of Jacobi's treatise on "Artificial Propagation," from the Latin version of Goldstein ("Traité générale des pêche," etc., Paris, 1773, Part II, p. 209). England was the first country to recognize the importance of this discovery of Jacobi. In 1771 George III granted him a life-pension. The first public illustration of the processes of fish-culture was given in 1772 by Prof. Adanson, in his lectures in the Royal Garden of Paris, now the *Jardin des Plantes*. The first English translation of Jacobi's memoirs was published in London in 1788, with the title "S. L. Jacobi's Method of breeding Fish to Advantage."

Notwithstanding the importance of this discovery, it was practically lost sight of for a long period, and it was then in France that the revival of the art took place. The chief importance of this renewed activity on the part of the French is to be found in the stimulus which it gave to new efforts in other countries, particularly in the relations of governments to the subject. The results accomplished by the

French were soon appreciated in England, and especially in America. One of the earliest American translators to bring to notice the essays of French fish-culturists was William H. Fry, who, in 1854, published "A Complete Treatise on Artificial Fish-Breeding: including the Reports on the Subject made to the French Academy and the French Government, and Particulars of the Discovery as pursued in England," etc. Dr. Theodatus Garlick, who is now generally recognized as the "father of fish-culture in America," in the preface to his treatise on the "Artificial Propagation of Certain Kinds of Fish" (Cleveland, 1857), bears testimony to the value of Fry's contribution to the history of fish-culture in Europe. Dr. Garlick had previously prepared the reports of Coste and Milne-Edwards on artificial fish-culture, for publication in the "Ohio Farmer," together with original articles, these papers being afterward combined to form the treatise above mentioned.

Previous to 1850 all that was accomplished in the way of artificial culture of fishes was done by individuals at their own expense. In 1850 fish-culture was begun by the French Government, and the first breeding station under government auspices was established at Hünigüe, in Alsace, under the direction of Prof. Coste. Here the practical application of artificial culture was first demonstrated. (See engraving, page 792.) Public fish-culture was not permanently established in the United States until 1865, when New Hampshire formed a fish commission, and the Legislature sent Dr. Fletcher to Canada, to obtain salmon-eggs. Massachusetts had taken a preliminary step ten years before, but New Hampshire made the first practical move. Massachusetts established its fish commission upon a working basis in 1865, and Vermont, also, created a commission in this year. The first hatching establishment for public fish-culture in the United States was the shad-hatchery erected at Hadley Falls, on Connecticut river, by the State of Massachusetts. Public fish-culture in America, originating in New England, has rapidly been introduced into other States, and at this time most of the States and Territories of the Union have fish commissions. The total amount of appropriations for State commissions from 1866 to and including 1882 was \$1,101,096.

On Feb. 9, 1871, the United States Government authorized the appointment of a Commissioner of Fish and Fisheries, as stated at the beginning of this article. The propagation of fishes was not contemplated by the Government till 1872, when, at the suggestion of the American Fish-Cultural Association, Congress requested the commissioner to undertake the work of increasing the valuable food-fishes of the country, and appropriated \$25,000 for the purpose. The total amount of appropriations for the work of the United States Commission, from 1871 to 1883, is \$1,190,955.45, of which \$727,545 was devoted to propagation; the re-

mainder was employed chiefly in the construction of hatching-houses and ponds and steam-vessels. The work of the commission is divided into three sections, as hereinbefore explained.

The beginning of fish-culture contemplated the propagation of different members of the *Salmonida*—trout and salmon; the former especially occupying attention. These fishes still claim a large portion of the time of fish-culturists everywhere; but other species now receive as much care. This is more noticeable in the United States than elsewhere, because of our numerous anadromous fishes of far greater economic value than any salmon, unless we may except those of the Pacific coast. The shad, the alewife, and the striped bass are among our most valuable anadromous species, and, fortunately, they are good subjects for artificial propagation.

Hatching-Apparatus.—The earlier forms of hatching-apparatus used in the United States were, naturally, imitations of foreign appliances, particularly those of France and England. Boxes were placed in streams, and the eggs were received upon a bed of gravel. Floating-boxes in streams were employed for many years, and are still used to some extent. The hatching-box invented by Seth Green, in 1867, was the first successful piece of apparatus used in the United States for the hatching of semi-buoyant eggs. This is a rectangular wooden box with a wire-cloth bottom, and with long wooden floats so attached to the sides as to tilt the box at an angle with the current, thus securing the necessary movement of the eggs during the period of incubation. Until recently, this was the only successful apparatus used for the hatching of shad, and in it many millions of this species have been developed. Formerly, it was a matter of considerable importance to select material for the construction of hatching-apparatus which would not act injuriously upon the eggs, but this was soon adjusted by giving a coating of asphalt to the whole interior of the box. The use of the floating-box involved the necessity of placing it in a stream where it was subject to various dangers. In tidal waters, too, there was frequently entanglement of the series of boxes, and a lack of current during the turning of the tide. The introduction of glass materials for hatching purposes, and the protection of this apparatus in hatching-houses, either floating or fixed, was a very great advance over the old methods. In the glass vessel, thus protected, it is much easier to regulate the force of the current, and to remove diseased or dead eggs, than it was in the early apparatus. Formerly, it was necessary to skim off, or pick out, the dead eggs; but this work is now done automatically and with great facility. Floating-boxes for the hatching of semi-buoyant eggs could be employed only where there was a current; hence, it became necessary to substitute some other form of apparatus, in which a

continual motion could be kept up independently of the action of the current. The plunging buckets, invented by Mr. T. B. Ferguson, which were operated by steam machinery, were at one time used instead of the Green box for hatching shad-eggs in still water; but they were soon replaced by less expensive apparatus.

At present, it is customary among fish-culturists to classify hatching-apparatus with reference to the kind of eggs for which it is intended to be used. Four types of eggs are recognized:

WHITE-FISH (*Coregonus clupeaformis*).

1. Buoyant eggs, such as those of the cod and the mackerel, which will float in water; 2. Semi-buoyant eggs, such as those of the shad and the white-fish; 3. Heavy eggs, such as those of the trout and the salmon; and, 4. Adhesive eggs, like those of the perch, the smelt, and the sea-herring, which adhere to surfaces with which they may come in contact. No form of apparatus has yet been devised which will satisfactorily hatch floating eggs. Some of the first experiments in the hatching of cod-eggs were made by Prof. G. O. Sars, of Christiania, Norway. At the International Fisheries Exhibition, in London, 1883, was shown a vase, invented by Mr. Oldham Chambers, for hatching buoyant eggs. In this the supply-pipes are perpendicular and perforated at an angle of forty-five degrees, and with an upward tendency, thus assisting the floating of the ova. A form of apparatus used with moderate success by the United States Fish Commission at Gloucester, Mass., in 1878, was devised by Capt. H. C. Chester, for eggs of the cod, and this was the first to accomplish the purpose desired. The hatcher known as "Chester's Semi-rotating Hatcher," is a cylindrical can, with five rectangular openings of wire-cloth on the side and a bottom of like material, to allow a circulation of water, and to prevent the loss of eggs or the escape of newly-hatched fish. Beneath the bottom are four strips of tin, radiating from the center and placed at such an angle that the rotation of the cylinder upon a vertical axis forces the water against them and up through the bottom. Several of these cans are placed in a trough of running sea-water. Each can turns on a pivot, the power being

applied from an engine by means of a horizontal arm fixed to its axis, and is kept constantly turning backward and forward through an arc of ninety degrees, thus creating a free circulation of water which gives a motion to the eggs.

For hatching semi-buoyant eggs, such as those of the shad, the Green hatching-box was formerly the only one successfully used in the United States. Several modifications of it have been made, the most prominent among them being that invented by Mr. Brackett, and first used in 1878. "In this the box floats horizontally,

but has the up-stream end beveled, and the water, striking against it, produces an eddy under the box, which causes a gentle agitation of the eggs." Another substitute was suggested by Mr. E. M. Stilwell, Fish Commissioner of Maine, and Mr. Charles G. Atkins, now in charge of the United States salmon-hatchery at Bucksport, Me. None of the modifications,

however, succeeded so well as the Green box. The form of apparatus now used by the United States Commission and by many of the State Commissions, is the hatching-jar devised by Col. Marshall McDonald, of the United States Fish Commission. This is "a glass jar with metal cap containing two circular openings. Through one of these, in the center, a glass tube for the introduction of water passes to within a short distance of the bottom of the jar. The other, near one side, contains a shorter glass tube, which serves as an outflow-pipe. The McDonald jar is successfully em-

McDONALD'S JAR.

ployed in the hatching of various species of heavy eggs," as well as for semi-buoyant ova. "The water in entering is thrown against the bottom with considerable force, and is deflected upward around the sides of the jar. The eggs, which tend to settle to the bottom, are

carried upward along the sides, thence inward toward the center, from which point they again sink to the bottom. The current is regulated to give the desired motion to the eggs. With heavy eggs like those of the salmon there is no motion, but the water coming from beneath tends to buoy the eggs upward, thus preventing any injurious pressure on the lower ones by the mass above. The outflow-pipe is movable, and can be lowered to a point where the dead eggs, which are lighter than the good ones, come in contact with it and are carried off. By this means the eggs are kept comparatively free from the injurious effects of fungous growth or decaying eggs." The jar is fifteen inches high, six inches in diameter, and has a capacity of five quarts. It "can be filled two thirds full of eggs

with very satisfactory results; 60,000 shad-eggs are considered a fair quantity."

For the hatching of heavy eggs, almost any device will answer. The early forms of boxes were perforated for the entrance of water, supplied with gravel to cover the bottom, and on this the eggs were deposited; the boxes were placed in running water, and hatching proceeded with little difficulty. Later, parallel glass tubes, or grilles, were substituted for the gravel. A very good invention for hatching heavy eggs in layers was the Holton box, patented March 18, 1873, in which the eggs in

the greatest advantages derived from the Holton hatcher was economy of space. In 1874 another device for securing the same ends was patented by Mr. N. W. Clark, of Clarkston, Mich. The Clark hatching-trough is divided into ten to twenty compartments, each 15 inches long, 12 inches wide, and 12 inches deep, inside measurement; the divisions are made by water-tight partitions or bulkheads. Each compartment contains a box in which is placed a series of trays filled with eggs and

SIR JAMES MAITLAND'S HOWIETOUN HATCHERY.

covered with a pan of perforated tin upon which the water falls, to descend upon the eggs in the trays beneath, escaping at the bottom, and then passing up around the sides and ends of the box on its way to the second compartment. All of the water passes through each compartment before it escapes through the waste-way at the end of the trough. This was intended more especially for white-fish, but is used for all salmonoids. The Williamson or California box is similar to the Clark box, but the water is introduced from below instead of above. This form is now extensively used in Germany.

In 1874 Mr. Livingston Stone designed an apparatus for hatching salmon-eggs in bulk by suspending from frames, in a Williamson trough, wire baskets containing the eggs. The compartments are separated by double partitions, the first reaching to the bottom and the second raised a little from it. The water falls over the first partition and passes under the second into the compartment, upward through the basket of eggs and out over the next partition. Mr. Stone often placed 12 to 15 layers of eggs in a basket without injuring them. One modification of the Holton system is the Ferguson jar, a cylindrical jar of glass containing wire-cloth egg-trays and having a circular opening

to admit water at the bottom and a similar one at the top for the outflow. This jar was patented in 1876. Before the Ferguson jar came Chase's hatching-jar, a cylindrical jar of glass with a metal rim notched at one side, and furnished with a screen to prevent the escape of the fish. In this excellent jar

COSTE'S TRAY.

single layers were received upon trays placed one above another; the current of water, entering from below, passed through each tray and escaped at the top. This was one of the earliest forms of apparatus by which an upward current of water is utilized, such apparatus marking a decided advance in the art. One of

the water is introduced through a funnel-shaped glass tube upon the bottom, and thence passes upward through the eggs. Clark's hatching-jar is similar to Chase's, differing mainly in having upon the bottom a metal cone to receive the funnel-shaped end of the supply-tube, which is kept from contact with the cone by slight projections on the inner surface of the tube. The Wilmot jar was subsequent to and in imitation of Chase's.

For hatching adhesive eggs, one of the earliest forms of apparatus employed was that described by Christian Lund, in Norway, in 1761. This was a box charred on the inside and lined

Lund's Box.

with bushes, its sides being perforated. This box was placed in shallow water near the bank of a river, and in it were confined the parent fish when about to spawn. The eggs adhered to the bushes and were left to hatch in the stream, but the fish were removed. Subsequently the sides were made movable, so that they, with the egg-bearing bushes, might be transported. The Lund principle of hatching adhesive eggs, with some modifications, is still extensively applied in many countries. In 1876 James Ricardo, of New Jersey, successfully used for hatching smelt a rectangular box with a hinged cover, and perforated ends furnished with wire-cloth, the inside provided with twigs to which the eggs became attached. This box was placed in a strong current in the river. In 1878 Mr. Frank N. Clark employed, for hatching eggs of the sea-herring, a rectangular box containing numerous oblique grooves in the sides, in which were placed panes of glass resting alternately on the bottom and at a distance of a half-inch above the bottom. The eggs were taken, impregnated, and hatched on these panes. The current of water passed over the top of the first pane, under the second, over the third, and so on. Adhesive eggs may be manipulated with great ease by the use of the McDonald egg-reel, a contrivance by means of which they are attached to cotton cord, to facilitate transporting and hatching. A frame 23 inches high and 14 inches wide supports a reel 12 inches long and 10 inches broad. Beneath the reel is a square box containing at the bottom a ball of twine, and receiving in the top a funnel 6 inches in diameter. One end

of the twine passes through the funnel and is fastened to the reel. The eggs are placed in water in the funnel, and, as the twine passes through them upon moving the reel, quantities of them adhere to it and are drawn upon the frame.

Methods of Treating Eggs.—For the fertilization of eggs two methods have been employed—the “wet” and the “dry.” It was at first supposed that the eggs must be received in water, some culturists even taking the trouble to press them out under the water, and the milt was treated in the same manner. This, the “wet” method, was superseded by the “dry” method, which some claim was first practiced in America; it was, however, first published by Vrascki, a Russian, in 1856, and is now used almost universally. By this method the eggs are received in a dry pan, and the milt is distributed directly upon them. It is claimed that 99 per cent. of the eggs have been impregnated by the “dry” process.

The method of impregnating fish-eggs in general is as follows: Having found a female from which the eggs will flow freely upon slight pressure, grasp her firmly with the left hand around the tail, pressing her head closely against your body; then with the right thumb and forefinger exert a gentle pressure on the opposite sides of the belly, beginning at the breast-fins and continuing about to the middle of the length. The eggs should be received in a dry pan. By similar treatment of the male, squeeze jets of milt upon the eggs, swaying the pan gently to and fro, to insure commingling of the two elements. (See engraving, page 796.) Add a little water from time to time until the eggs increase in size and feel hard to the touch. All foreign substances, such as scales, dirt, blood, etc., must be carefully washed off. The period of incubation of fish-eggs depends upon the temperature of the water, increasing with a rise and diminishing with a fall. In the treatment of eggs of salmon and white-fish, artificial refrigeration is employed to retard development and protract the hatching-season. In a state of nature the white-fish season is especially brief, but by refrigeration, Frank N. Clark, of the United States Fish Commission, has extended it materially, and is now developing three times as many eggs as he could without refrigeration. Sir James Maitland has taken advantage of another principle of retardation. By giving the females an abundance of substantial food when the pairing-season approaches, he can perceptibly hasten the date of spawning, and by feeding them sparingly he can materially retard that event. In this way he extends the hatching-season of salmonoids considerably.

The production of shad has been greatly increased by Col. McDonald's discovery of the method of transportation of eggs in the dry state. The eggs, after fertilization, are placed in trays with a wire-cloth bottom and covered

by a wet cloth; eighteen of the trays fill a crate, which is inclosed in canvas and secured by frames connected by leather straps. The crates are then shipped to the hatchery.

Oysters.—Artificial hatching of eggs is not confined to the fishes; it has recently been successfully applied to the oyster, although it can not be asserted at present that this process may be profitably employed in oyster-culture. A great difficulty encountered by those who first attempted the artificial propagation of the oyster, was the escape and loss of the embryos before they became fixed. John A. Ryder, embryologist of the United States Fish Commission, has hit upon a device for detaining the embryos and compelling their fixation upon artificial stools. The pond in which he operated was supplied from the bay through a diaphragm constructed of boards perforated with auger-holes, and lined on the inside with gunny-cloth, the space between the boards, two inches, being filled with sharp, clean sand. Through this porous gate the tide ebbed and flowed, the temperature and saltiness of the pond remained the same as that of the bay, and the young oysters found the necessary food, and grew as rapidly as in the waters of the open bay. The method of rearing now so largely and successfully employed is that of receiving upon artificial stools spat naturally produced, empty oyster-shells being employed to receive the seed. By such means very much has been done in the New England States and elsewhere toward increasing the market supply of oysters. Another development of oyster-culture is the planting of oysters upon suitable bottoms and allowing them to remain there to grow and fatten.

Sponges and Lobsters.—Sponges have been artificially propagated from cuttings. Illustrations of sponge-culture were shown at the International Fisheries Exhibition, by McKesson and Robbins, of Florida. It is claimed that this may become a successful industry. The artificial culture of lobsters has received much attention in some of the European countries. Attempts have been made by the United States Fish Commission to transport adult lobsters to the Californian coast, but without successful results from the introduction.

Results of the Commission's Work.—Most of the States have fish commissioners, who undertake to supply the streams of their own States. The General Government occupies itself with such bodies of water as the great lakes, with rivers which no single State or combination of States could be expected to take under its charge, and with marine species. It undertakes, also, the acclimatization of species which must be brought long distances and at great expense, as well as transportation across the continent, and even to remote countries. Some of the results are so well known that it seems hardly necessary to mention them. We might refer to the successful introduction of the shad in the Mississippi Valley and upon the Pacific slope; to

the improvement of the shad-fisheries in nearly every important river which has recently been stocked; to the great impression made upon the coregonus fisheries of the great lakes; to the deposit in 80,000 ponds of the German carp; to the annual increase of nearly 5,000,000 pounds of salmon in the Sacramento river, due to the artificial breeding in the McCloud; to the successful introduction of the California salmon into Europe, where it thrives in ponds; and to the general improvements in fish-hatching apparatus.

Practical Information.—The limitations of fish-culture are purely physical. Cold or obstructions or impurity of the water, may neutralize the efforts of the fish-culturist, just as frost, or flood, or plague, may render unavailing the labors of the agriculturist; but the practicability of the art remains the same. Because of the general interest in several of our native species, I append brief descriptions of the methods employed in their propagation. The notes relate to some of the salmonoids, the shad, and the carp:

Trout and Salmon.—One of the first requisites for hatching eggs of the *Salmonida* is a steady supply of pure spring-water, having a uniform and low temperature. If the water contain sediment, this must be kept out of the hatching-apparatus by a series of filters. Perhaps the best temperature of water for hatching purposes is about 45° Fahr.; it would not be well to have it much higher. In water of 45° trout-eggs will hatch in about seventy-five days, and the yolk-sac will remain nearly fifty days longer. For the proper accommodation of the apparatus and the embryo fish, a hatching-house is necessary. Neither rain-drops nor the sun's rays must fall upon the eggs. Modern apparatus made of glass, and closely sealed, except where the water enters and escapes, will prevent numerous accidents.

Connected with the hatchery must be a series of ponds, which should be at different levels and united by long, narrow race-ways. The rearing-ponds are to be supplied with brook or river water of a temperature never exceeding 65° Fahr. The fishes of each pond must be prevented by screens from leaving their inclosure. The depth of ponds is made to vary with the size of the fish, and from the head, where it is usually about six inches, to the foot, which, in the largest pond may measure six feet. It is customary to construct ponds narrow and long, with a view of sweeping them readily with a seine. It is desirable to arrange the ponds so that they can be entirely emptied when necessary. Fish kept in confinement must be fed. Feeding should begin a week or two before the yolk is entirely absorbed. One successful fish-culturist uses a mixture of the yolks of nine eggs with one pound of beef, which is pressed through a fine sieve. Livingston Stone believes that young living perch and suckers, which can readily be obtained in abundance, would probably be the best food for very young trout; but as artificial food he recommends liver and curd from sour milk in about equal proportions, or with two parts of liver to one of curds. Raw liver alone is extensively used; it must be chopped quite fine and pressed through a fine sieve. Seth Green reduces it to the consistency of pulp, and, after diluting it with water to about the thickness of cream, gives a teacupful of the mixture to 100,000 fish just beginning to feed. The larvae of gnats, as well as of *Daphnia*, *Cyclops*, etc., may be skimmed off stagnant waters with a fine muslin net, and fed to the young fish. Whatever is given to the fry, care must be taken that it does not choke them, and no refuse must be allowed to remain in the water to putrefy.

Artificial Impregnation of Shad-Eggs.—After the shad are taken from the gill-nets or seines, they should be examined to see if the eggs and milt will flow out freely when gentle pressure is made upon the belly.

If the process of taking eggs or milt is continued too long, traces of blood will appear. After impregnation, the eggs should be kept either in pans or on trays; if in the former, they must be filled with water, which should be changed every hour or oftener. In pouring water into the pans, always let it fall on the side. The eggs must be preserved from shocks

traced top and a cover. The usual dimensions are: height, 24 inches, diameter, 14 inches. This can will accommodate from 5,000 to 20,000 embryos, depending on the distance to be traveled and the time occupied in transit. Until recently it was supposed to be necessary to change the water at least once in two hours. Now it is known that a change every four or six hours will generally give better results. Young shad have been kept alive and deposited in streams after a journey lasting 184 hours; they have been kept alive even as long as 240 hours by Messrs. Mather and Anderson in the attempt to carry them to Germany.

Carp-Culture.—The carp is said to have been introduced into Europe from Central Asia many centuries ago. It is now common in most of the large European rivers, and has become extensively domesticated in Bohemia, Austria, Germany, and France. From Europe the carp was imported into England in 1514 by Marshall. One of the varieties was brought from Holstein to Sonoma,

California, in 1872, by Mr. J. A. Poppe, and, from the five puny little fish which he placed in one of his ponds in August of the same year, many portions of his own State and of those adjacent were supplied with scale-carp, and some were sent even to the Sandwich islands. A much more extensive introduction of a superior breed of carp into the United States was effected by the commissioner, May 26, 1877, on which day Mr. Rudolph Heasel placed in ponds in Druid Hill Park, Baltimore, 237 naked and mirror carp and 118 common carp. These were kept in Baltimore until the completion of the ponds in Washington. The distribution of young carp reared in Washington began in 1879, and up to the present time upward of 30,000 ponds have been supplied in all suitable parts of the United States. Shipments have been made, also, to Columbia and Ecuador. The successful domestication accomplished in Europe has been repeated here. The varieties of carp known among us are three: the common, or scale-carp, the mirror-carp, and the leather-carp. Carp will hybridize with gold-fish and with other related members of the family of the *Cyprinidae*, forming a worthless and

SHAD (*Clupea sapidissima*).

of all kinds. When trays are used, the bottom of the tray should be covered with a wet flannel cloth, and the eggs must not be more than two layers deep. The apparatus used by the United States Fish Commission for the transportation of eggs is McDonald's egg-transportation crate, described above. This crate marks the beginning of the dry transportation of shad-eggs.

The spawning-pans used by the commission are made of "marbleized iron," which will not rust in salt-water.

The period of incubation of all fish-eggs varies with the temperature of the water. I quote from the "Report of the United States Commissioner of Fish and Fisheries," Part II, p. 430, the record of observations made by Mr. J. W. Milner: "In the shad-eggs the period required for the release of the fish from the eggs was, with an average temperature of 64°, though actually varying between 62° and 68°, about seven days. With an average temperature of 65°, actually between 62° and 69°, the time was about six days. With an average temperature of nearly 66°, actually between 62° and 69°, the time for the most of the fish to be free was about five days.

An average of 68°, between 60° and 75°, released them in about three days. An average of 72°, really between 65° and 80°, released the fish in about seventy hours, the shortest time observed for a large quantity of eggs, though usually some were hatched a few hours before the majority, and a few eggs lingered for several hours after the *éclosion* of the rest." A newly-hatched shad is a little less than half an inch long. The yolk-sac is absorbed in four or five days after hatching. Glass vessels are the best for hatching purposes; the Chase, the Clark, and the McDonald jars possess great advantages over

all forms of metallic apparatus, the principal being their prevention of the formation of fungus, by the continuous movement which they insure, and the facility for removing dead eggs. Embryo shad are transported in cans of block-tin, resembling milk-cans. The style extensively used by the United States Fish Commission is cylindrical, with a con-

CARP (*Cyprinus carpio*).

troublesome product, which can not easily be distinguished externally from true carp. Carp prefer stagnant or sluggish waters, with a loamy, muddy bottom, and deep places abounding in vegetation. They live upon vegetable food, worms, and insect larvae, and will sometimes devour their own eggs and the bait intended for predaceous species. They hibernate

CARP PONDS, WASHINGTON, D. C.

in deep water, refusing food, in moderately cold countries, from October to April. In the warmer Southern States the period of winter sleep is greatly reduced, and the time of growing increased. Carp do not lose weight in their natural retreats during winter, nor do they grow. The spawning-season begins when warm spring weather has fairly set in, and continues into July, or later. The number of eggs averages about 100,000 for each pound of the weight of the fish. The scale-carp is somewhat more prolific than the other two varieties. The favorite spawning-places are spots overgrown with such aquatic plants as the bladder-worts (*Utricularia*), water-plantain (*Alisma*), water-milfoil (*Myriophyllum*), pond-weed (*Potamogeton*), and some members of the water-lily family. The eggs are adhesive. The period of incubation depends mainly upon temperature; in the colder portions of New England it may be sixteen days, while in Georgia it has been reduced to as little as forty-eight hours, with a temperature of 90° or more.

The rate of growth of the carp depends upon the average temperature of the water, the nature of the bottom of the pond or river, the amount of food, and the extent of water area. According to Rudolph Hessel, a carp-culturist of wide experience, who has charge of the ponds of the United States Fish Commission, the average normal weight of a three-year-old carp of any of the three varieties is three pounds. This average may be greatly increased or diminished through variations of the conditions above mentioned. The carp may be reared in brackish waters, as well as in rivers, lakes, and ponds.

In establishing ponds it is desirable to have a sufficient supply of brook or river water at all seasons. The bottom of the pond should consist of clayey loam intermingled with some marl or vegetable mold. But there must not be too much humus or dissolved peat. Surface drainage from fertile fields is advantageous in carp-ponds. Artificial ponds are most readily constructed in a low, undulating region which is without great elevations, and where reservoirs may be cheaply formed by closing up the small valleys by dams. The depth of the pond need not exceed three feet in the center, and from the margin to a distance of 70 or 100 feet it should not be more than one foot. The area intended for breeding must be still shallower, not ex-

ceeding a few inches in depth. Near the center of the pond a deep cavity, fully two feet lower than the rest of the bottom, and varying in size according to the area of the pond, must be dug, to serve as a retreat from excessive heat and cold. The pond must be so made that it can be perfectly drained. Near the outflow end must be provided another excavation, about one foot deeper than the rest of the pond, to receive the fish when the water is drawn off through the outlet-pipe; this cavity is called a "collector." The drainage is effected by means of a main ditch leading into the "collector," and having intersecting ditches from all parts of the pond. The "collector" ought to have a plank flooring, and must be kept free from mud. The inflow of water into the pond from a stream should be lateral and never direct. Both the inlet and the outlet of the pond must be supplied with series of screens, to prevent the escape of the carp and the intrusion of other fishes. All wood-work exposed to the action of the air, or the water, or both, should be well protected by paint or some other preservative. If the pond receives a considerable supply of surface-water, or is liable to overflow in rainy weather, an "overflow" must be provided at the side, and this must be protected by wire-cloth screens. Knolls and islands must be entirely removed from the pond, or they will serve as lodging-places for numerous enemies of the fish. In stocking ponds, three females and two males, or sometimes twice as many of each sex, are allowed to one acre of water. Mr. Hessel recommends that small ponds be surrounded by a tight board fence, three to four feet high, and imbedded in the ground from four to six inches. This will keep out the snapping-turtle, the most voracious and dangerous enemy of the carp. Aquatic birds, otters, musk-rats, minks, frogs, water-snakes, and a host of other animals, in the water and out of it, prey upon fish and are especially destructive to carp. Carp must be kept entirely apart from other fishes, and they must be protected from the enemies above mentioned. Facility in draining the pond will insure the extermination of foes within, and the outside foes must be killed by shooting and trapping. Regular carp-culture requires a hatching-pond, a breeding-pond, and a culture-pond. The hatching-pond need not be as large as the breeding-pond, and its depth should not

be greater than eighteen inches. Its shallow margin may be from thirty to forty feet wide and from two to five inches deep. Water-grass (*Potamogeton*) should grow in it plentifully. The breeding-fishes should be removed after the close of their spawning-season. The young fry are to be left in the hatching-pond during one winter, and are then transferred to the breeding-pond. The breeding-pond is constructed in the same way as the hatching-pond, but it is larger and deeper; its average depth may be twenty-one inches, and the "kettles" or retiring-places may have a total depth of four and a half feet. The shallow margin should be from seventy to eighty feet wide. There should be a good growth of grass in this pond. They are to be stocked in March and April from the hatching-pond. About 800 carp to the acre is a fair average. After remaining one year in the breeding-pond, the fish should be transferred to the culture-pond, 400 to 500 being allowed to an acre.

In feeding carp, distribute the food in different places near the banks, and change the feeding-place frequently. Do not give them much food at one time. The best times are early in the morning, or in the evening, and, in hot weather, late at night. Never use more food than the fish will consume, else fragments will remain in the pond to putrefy and cause sickness among them.

Bibliography.—The literature of fish-culture is extensive and scattered. A list of the principal treatises accessible to American readers is given below. In addition to the papers and books mentioned, much and varied information upon the subject is to be found in the reports of the United States Fish Commissioner, Bulletin of the United States Fish Commission, reports of many of the State Fish Commissioners, and Transactions of the American Fish-Cultural Association. The papers bearing the date 1868 were read at the conferences of the International Fisheries Exhibition of 1883; they are, as a rule, modern, comprehensive, and valuable:

Fry, W. H.—A Complete Treatise on Artificial Fish-Breeding: including the Reports on the Subject made to the French Academy and the French Government; and Particulars of the Discovery as pursued in England. Translated and edited by W. H. Fry. Illustrated with Engravings. (New York, 1854.)

Garlick, Theodatus, M. D.—A Treatise on the Artificial Propagation of Certain Kinds of Fish, with the Description and Habits of such Kinds as are the most suitable for Pisciculture, etc. (Cleveland, 1857.)

UNIVERSALISTS. The following is a summary of the statistics of the Universalist Church in the United States, as given in the "Universalist Register" for 1884: Number of State conventions, 22; of parishes, 919; of families, 88,320; of churches, 696; of church-members, 85,058; of Sunday-schools, 609; of members of Sunday-schools, 52,758; of clergymen in fellowship, 672, with 11 licensed lay preachers; of church edifices, 797, of which the value, above indebtedness, is \$6,894,100. There were 12 schools and colleges in 1883, with 101 instructors and 1,063 students, and property valued at \$2,378,000.

The Universalist General Convention met in Washington, D. C., October 24th. Mr. John D. W. Joy, of Massachusetts, was chosen president. The Board of Trustees reported that the contributions and bequests actually paid during the past year for the missionary work of the Church, through conventions and otherwise, had amounted to more than \$75,000; and that the actual receipts from gifts by the educational institutions exceeded \$254,000. The Murray centenary fund amounted to \$128,932; the theological scholarship fund to \$18,044; and the J. G. Gunn ministerial relief fund to \$8,790. The church in Washington, D. C., in which the sessions of the convention were held, had been completed at a cost of \$46,058, all of which was paid before the meeting adjourned. The payment of the entire indebtedness of the General Convention was also announced. A committee, to which had been referred the subject of a revision of the creed, reported that it had come to the conclusion that no general revision was called for at this time. "The present profession," the report said, "may not be regarded as a complete statement of doctrine, nor should it be held as too sacred for amendment. Beyond question,

however, this formula expresses in substance the fundamental beliefs of Universalism, while it is happily adapted for use by the brief forms in which its propositions are affirmed." The committee, however, recommended a modification in the second article of the declaration, by the substitution of the word "save" for "restore" and of "in" for "to," so that the article should read, "We believe that there is one God, whose nature is love, revealed in one Lord, Jesus Christ, by one Holy Spirit of Grace, who will finally save the whole human family in holiness and happiness." The convention was not satisfied with this proposition, and the report was recommitted. A minute was adopted expressing admiration of the character and courage of Martin Luther, and appreciation of the value of the work he did, and recommending the participation of Universalists in the celebration of the four-hundredth anniversary of his birthday. An additional or assistant secretary was appointed, to advance missionary work in the West.

The Woman's Centenary Association had received \$14,745, and had paid out \$9,668. Its work is the maintenance of missions in the United States, Canada, and Scotland.

The Universalist Historical Society reported 2,500 volumes in its library.

URUGUAY, a republic of South America. Area, 69,835 square miles; population, 488,245; capital, Montevideo. The President is Gen. Maximo Santos, elected March 1, 1882, after the resignation of Dr. Vidal, for the term of four years. The Consul-General for the United States is H. Estragulas, resident in New York.

Army.—The standing army comprises four battalions of foot, three regiments of horse, and two regiments of artillery, together 4,500 men. There is besides a police force of 3,200 men, and a national guard of 20,000 men.

Finances.—The public indebtedness stood, on Jan. 1, 1883, as follows:

Debts redeemable without being liable to interest	\$14,970,167
Debts originally bearing 12 per cent. interest, but subsequently converted into consols bearing 5 per cent. interest during three years, and 6 per cent. during the subsequent seven	17,148,981
Debts bearing 2 and 3 per cent. interest during a term of ten years	27,465,756
Total	\$61,579,904

The income in 1883 was \$9,920,000, and the outlay \$9,925,000. During the summer of 1883 Uruguay caused a meeting of its foreign bondholders to be held in London, and an arrangement was made to the following effect: The home and foreign debts were acknowledged to constitute the following equivalents in English money:

		Interest.
Internal debt	£9,112,220	£519,462
External debt	3,467,520	86,388
Total	£12,579,740	£606,850

The consolidation of this joint indebtedness has been effected by leaving the amount due

foreign creditors as it stands above, but reducing the internal debt, some of which, as shown, bore no interest, by about 60 per cent. The consolidated debt was thus fixed at £11,127,000, including £851,000 of a new issue.

A National Bank.—Parliament passed the bill creating a national bank. The bank is to be incorporated for forty years, and to have its seat in the city of Montevideo, where it will remain, subject to the laws of the republic. The capital is to be \$10,000,000, in shares of \$100 each, 50 per cent. to be paid in cash, and the remaining half in two years, unless an earlier call for the same should become imperative. Branch banks are to be established.

The Tariff.—During 1883 the Committee on Revision of the Tariff terminated its labors. It proposed a notable raising of the duties, especially on articles imported from France.

Postal Service.—The post-office forwarded, in 1883, 1,000,000 ordinary letters, 20,000 registered ones, 70,000 Government dispatches, 1,000,000 periodicals; paid out \$2,000,000 of money-orders, and collected \$140,000 of postage, there being in operation 294 post-offices.

Railroads.—The railroads in operation in 1883 were: 1. The Central of Uruguay, in running order 205 kilometres from Montevideo to Durazno, 210 to the Yi river, and 32 of branch line to San José; about to be added, 70 kilometres. 2. Ferro-carril del Peste; length of line in operation, 35 kilometres. 3. Ferro-carril del Salto; out of 181 kilometres to be built, 100 were in operation. 4. Ferro-carril del Norte; length of line, 21 kilometres.

Telegraphs.—There were in operation in 1883 five lines of telegraph. On Jan. 25, 1883, the Uruguayan Government signed a convention with that of the Argentine Republic, authorizing the former to extend its land lines and establish a new one to connect with the Argentine system on the island of Martin Garcia.

Telephones.—The "Compañía Telefónica" of Montevideo was founded in 1882, and in the year following had a length of line in operation of 360 miles.

Education.—There were in 1883, 688 public and private schools, attended by 42,486 pupils, 22,944 of whom were boys and 19,542 girls, taught by 1,182 teachers.

The Press.—The Oriental press was represented in 1883 by twenty-one daily newspapers and forty weeklies and magazines, the aggregate circulation being 20,000.

Cattle and Sheep Show.—The Rural Association of Uruguay held its first cattle and sheep exhibition at Montevideo on Oct. 1, 1883. Premiums were awarded to raisers of the finest rams, and it was made apparent that sheep-breeding had made marvelous progress in the Oriental country.

Live-Stock.—So far as the official direct-tax returns show, the live-stock in Uruguay was distributed as follows in 1883:

DEPARTMENTS.	Head of cattle.	Sheep and goats.
Salto.....	1,040,420	616,194
Paysandú.....	722,982	459,215
Río Negro.....	488,178	709,890
Soriano.....	292,481	2,015,106
Colonia.....	142,496	1,314,984
San José.....	196,548	1,907,902
Florida.....	170,064	1,329,494
Canelones.....	18,405	112,842
Durazno.....	285,802	1,101,758
Tacuarembó.....	1,066,515	754,564
Cerro Largo.....	881,854	405,970
Minas.....	278,566	655,008
Rocha.....	280,008	261,818
Maldonado.....	98,171	204,982

There were believed to be in all the republic about 8,000,000 head of cattle, estimated to be worth on an average \$6 a head; 16,000,000 sheep at \$1, and 1,000,000 horses and mules at \$5. The annual slaughtering of cattle was estimated in 1883 at 1,000,000 head.

The amount of iron and wire fence in position in Uruguay in 1883 was estimated to represent a value of \$10,000,000.

Agriculture.—There were of arable lands under cultivation in Uruguay in 1883 about 500,000 acres, and pasturages of 85,000,000. Wheat and maize are extensively grown.

Immigration.—Between 1866 and 1875, both inclusive, there landed in Uruguay 162,592 immigrants; in 1876, 5,570; in 1877, 6,168; in 1878, 9,464; in 1879, 11,188; in 1880, 11,867; in 1881, 8,336. There left, on the other hand, 6,376 emigrants in 1878; in 1879, 6,250; in 1880, 6,641; and in 1881, 6,389.

Commerce.—The amount of merchandise imported into Uruguay in 1883, in the absence of official returns at the close of the year, was estimated at \$20,000,000 worth; the exports at \$22,000,000.

American Trade.—Uruguay's trade with the United States has been as follows:

FISCAL YEAR.	Import from Uruguay.	Export to Uruguay.
1880.....	\$5,542,085	\$880,871
1881.....	4,164,669	1,598,326
1882.....	6,897,736	1,457,978
1883.....	8,930,110	1,365,755

While importation from Uruguay has fluctuated widely, exportation has risen suddenly, and since then remained tolerably steady.

The wool and hide importation from Uruguay has been as follows:

	Wool.	Hides.
	Pounds.	
1880.....	9,577,879	3,575,735
1881.....	4,823,562	2,960,259
1882.....	6,894,985	5,038,258
1883.....	5,920,718	2,716,240

From this it is evident that the falling off in American importation from Uruguay has been due chiefly to the decreased amount of hides coming from there.

UTAH. Territorial Government.—The following were the Territorial officers during the

year: Governor, Eli H. Murray; Secretary, Arthur L. Thomas; Auditor, Nephi W. Clayton; Treasurer, James Jack; Superintendent of Public Instruction, L. J. Nuttall. Supreme Court: Chief Justice, John A. Hunter; Associates, P. H. Emerson and S. P. Twiss.

Material Condition.—The assessed value of property in 1882 was \$29,080,656; Territorial and school taxes thereon, at $\frac{1}{2}$ of 1 per cent., \$174,483.93.

In 1883 the assessed value of property was \$30,834,425, with no returns from Emery and Piute counties. The gross revenue for the two years 1882 and 1883 was estimated by the Auditor at \$459,390.48; net revenue, \$323,559.44. The Treasurer's report shows payments during the two years to the amount of \$307,669.05; balance in treasury, Dec. 31, 1883, \$51,988.10.

The area of the Territory is 84,000 square miles. The population is about 150,000, about 40,000 being non-Mormons, many of whom are so-called apostates from the Mormon Church. The people are generally engaged in agricultural pursuits. Since 1869 the business of mining has become an important interest, and from that time the total out-put has been over \$60,000,000 in silver, lead, and gold. There are also valuable deposits of coal, iron, and copper.

The bullion product of 1882 has been stated at \$8,143,175; 1883, \$7,017,682. There is a territorial insane asylum at Provo city.

Polygamy.—On July 1, 1862, an act was passed by Congress which provides that "every person having a husband or wife living, who marries another, whether married or single, in a Territory or other place over which the United States have exclusive jurisdiction, is guilty of bigamy, and shall be punished by a fine of not more than \$500, and by imprisonment for a term not more than five years." Under this law there have been very few convictions, not more than three, as it is said, for over a period of twenty years, which is due largely to the fact that a great majority of the community are in sympathy with the accused. The law of March 2, 1862, known as the "Edmunds law," is much more comprehensive. In addition to repeating the same penalty for entering into the polygamic relation, it amends the former law by providing a penalty "against any man who simultaneously, or on the same day, marries more than one woman." New sections are introduced into the present act relating to the qualification of jurors, amnesty to offenders, and the legitimation of children born before Jan. 1, 1883. The last section declared vacant the registration and election offices in Utah, and provided for a board of five, appointed by the President, to take their place.

The Commission and its Action.—Under this act, Alexander Ramsey, A. S. Paddock, G. L. Godfrey, A. B. Carlton, and J. R. Pettigrew were appointed commissioners, and proceeded to the discharge of their duties in August of that year. They conducted a revision of the registration, appointed election officers, and under

their direction, and the provisions of the "Edmunds law," an election for delegate to Congress was held on Nov. 7th. The total number of registered voters was 33,266, of whom 18,772 were males and 14,494 females. About 12,000 men and women were excluded from registration by reason of polygamy. The election resulted in the success of John T. Caine, the candidate of the "People's party," or Mormons, who received 23,039 votes, while Philip T. Van Zile, the candidate of the "Liberal party," or Gentiles, received 4,884.

But the most important election was that of Aug. 6, 1883, a general election for Territorial and county officers; 960 were elected, all of whom, as well as all the voters, are monoga-

mists. The total vote of the People's party was 20,508; Liberal, 1,453; from which it appears that large numbers of the Liberals refrained from voting. The Legislature is composed wholly of Mormons, none of whom, however, *live* in polygamy.

The commissioners, in their reports to the Secretary of the Interior, make many statements and recommendations; the chief one being that Congress should pass a comprehensive marriage law, requiring marriages to be solemnized publicly and registered, and making the first wife a competent witness in prosecutions for polygamy.

Acts are now before Congress embodying the recommendations of the commissioners.

V

VENEZUELA, a republic of South America. Capital, Carácas. (For details relating to area, territorial divisions, population, etc., see "Annual Cyclopædia" for 1881.) The President is Gen. A. Guzman Blanco. The Venezuelan Minister Resident, accredited to the United States in 1880, is Señor Simon Camacho.

The Army and Navy.—The regular army has a strength of 2,545 men; in times of war the militia is enrolled. The navy is restricted to two small steamers and two schooners, mounting together eight guns.

Finances.—The budget for 1882-'83 estimated the income from duties at \$19,425,000; from internal revenue at \$2,596,667—together, \$22,021,667; and the outlay: General administration, \$12,285,000; interest on home debt, \$2,097,900; interest on foreign debt, \$2,097,900; payments in settlement of foreign claims, \$1,010,100; public works, \$4,530,767—together, \$22,021,667.

The internal debt amounts to \$45,876,064, and the foreign debt to \$273,403,659.

Decree of 1883.—The Venezuelan Government issued in 1883 the following decree:

The products, goods, and merchandise exported from Europe and the United States to Venezuela, and accompanied with all the documents required by the customs laws, may be transhipped in foreign colonies from one vessel to another to proceed to their destination, and will be considered as arriving directly from the original points of export. When, by lack of immediate transport, it may become necessary to disembark the said products, goods, and merchandise in foreign colonies, they may be re-embarked for Venezuela without being considered as colonial exports, always provided that, in addition to the consular documents from the port of original dispatch, the owners or consignees present at the custom-house of the republic where the goods are landed a certificate from the Venezuelan consul in the colony, asserting that the said goods were only there on deposit for lack of vessels to take them to their destination.

This decree removed the extra import duty of 80 per cent. upon goods introduced into Venezuela by way of the Antilles.

Railroads.—The railway from La Guayra, the port of Carácas, to the latter city, recently

opened, though only twenty-four miles long, encountered great obstacles from the fact that a mountain 7,000 feet in height separates La Guayra from the capital. Another line of railway was in operation from Tucacas to the Aroa mines, seventy miles. A line was being built from Carácas to the Tuy river, and work is begun on the railroad that is to connect Puerto Cabello with Valencia.

Telegraphs.—On Sept. 1, 1880, there were in operation 356 miles of line. In 1883 the western line had reached the Colombian frontier, with branch lines from Valencia to San Carlos, from Valencia to Nirgua, San Felipe, and Barquisimeto, and from Valencia to Puerto Cabello; the southern had extended to Villa de Cura, and the eastern to Guacara. From Villa de Cura the southern will be carried to San Fernando, the western from San Carlos to Barinas, and from Puerto Cabello to Maracaybo.

Education.—In 1873 there was spent by the nation only \$129,042 for gratuitous instruction of children and youths; in 1877 the amount spent was \$507,962, and in 1882 \$1,349,039 was thus expended. Various Federal colleges and normal schools have also been founded, there being four of the former of the higher order, and fifteen of a degree lower, including five for girls and five normal schools.

Agriculture.—The only plow in use (says the United States consul) is of domestic manufacture, made by pointing a round stick about six inches in diameter and incasing the point in iron. This iron-pointed stick set in a frame at a suitable angle and drawn by a team turns a furrow each way, very much as a hog would root it. Most of the tilled land is cultivated by hoeing. Of the cultivated crops, corn or maize is the most important. Near the cities it is grown expressly for horse-feed, and it is likewise the principal food of all the ox-teams, horses, mules, and donkeys used for the interior transportation of merchandise. The trade in green corn-stalks is heavy and regular. In places remote from the large towns the corn fully matures and is sold in the grain. The

corn is of excellent quality, and in quantity ample to supply the home demand. Three crops of corn a year can be raised on the same land. Sugar-cane is grown by a process of cultivation similar to that of corn. Sugar is produced in quantities sufficient to supply the home demand. Nine or ten varieties of beans are grown, and usually in great perfection, but only in quantity sufficient for domestic use.

Yanuari Gold-Mines.—These rich mines were more productive than ever in 1883, the "Callao" mine averaging 5,000 ounces monthly, the "Potosi" 1,500, and the "New York" 1,800, without counting the yield obtained at the "Eureka," "Chile," "Cicabra," "Nacupay," and numerous other quartz gold-mines. The mines are situate at a distance of sixty leagues from Ciudad Bolivar.

Commerce.—The imports into Venezuela in 1882 amounted to \$14,000,000 worth of merchandise, of which \$5,000,000 came from England, \$2,400,000 from France, and \$2,000,000 from the United States. The amount of products exported in the same year was \$15,000,000. The United States consul at Puerto Cabello remarked in January, 1883: "It may be reasonably stated, however, that the consumption of purely British goods is no greater than the consumption of American goods in Venezuela. In the character of the goods, however, both England and France have the advantage, for their exports thither consist principally of manufactures, while the principal portion of American exports thither is limited to provisions, breadstuffs, petroleum, etc."

FISCAL YEAR.	Imports from Venezuela into the United States.	Domestic exports from the United States to Venezuela.
1880.....	\$6,080,092	\$2,268,705
1881.....	6,601,817	2,704,068
1882.....	5,746,800	2,187,100
1883.....	5,901,724	2,863,211

The imports in 1883 embraced 47,742,466 pounds of coffee, worth \$4,498,207.

VERMONT. State Government.—The following were the State officers during the year: Governor, John L. Barstow, Republican; Lieutenant-Governor, Samuel E. Pingree; Secretary of State, George Nichols; Treasurer, William H. Du Bois; Auditor, E. Henry Powell; Inspector of Finance, Charles Dewey; Railroad Commissioner, Wayne Bailey; Adjutant-General, Theodore S. Peck; Superintendent of Public Instruction, Justus Dartt. Supreme Court: Chief-Justice, Homer E. Royce; Assistant Judges, Timothy P. Redfield, Jonathan Ross, H. Henry Powers, Wheelock G. Veazey, Russell S. Taft, and John W. Rowell.

Political.—There was no general election during the year, nor was the Legislature in session. At the town meetings on March 6th two amendments to the Constitution were submitted to the people. The vote was as follows: On the first, providing for the election of Secretary of State and Auditor by the peo-

ple—for the amendment, 11,135; against, 556. On the second, providing for an additional oath to members of the Legislature that they hold no United States office—for the amendment, 11,056; against, 559.

Finance.—The following statement shows the financial condition of the State at the close of the fiscal-year ending July 31, 1883:

LIABILITIES.	
Agricultural College fund.....	\$125,500 00
United States surplus fund, unpaid balances to soldiers and outstanding checks, about.....	20,000 00
Due towns on account of savings-bank tax, balance of 1883 tax, payable Aug. 25, 1883.....	24,875 53
Temporary loan, 1883, unpaid.....	40,724 15
Huntington fund.....	4,404 47
Total Liabilities.....	\$225,504 90

ASSETS.	
Cash on hand and in bank.....	\$50,923 54

The annual statements have lately exhibited a cash balance of about \$100,000 to the credit of the State, and a similar sum in available assets with which to meet current expenses. The change in this respect in the exhibit this year is by reason of the adoption of the Hooker revenue bill. By the provisions of that bill the railways, savings-banks, and trust companies, express, telegraph, and telephone companies, steamboat, car, and transportation companies are required to pay the tax assessed upon their earnings semi-annually, in the months of February and August, and the insurance companies annually, in February.

The total valuation of real and personal estate is \$154,135,984. To 1 per cent. of this sum add \$151,810 for 75,655 polls at \$2 each, deduct \$2,442 for exemptions, and the total grand list of the State is \$1,690,227.84.

The following table shows the results of the corporation tax law for the first year of its operation, with the exception of a few companies that had made no returns:

Savings-banks.....	\$52,771 78
Trust companies.....	20,509 67
Telegraph companies.....	597 58
Express companies.....	1,233 69
Steamboat companies.....	1,949 24
Car companies.....	5,964 63
Railways.....	67,087 27
Insurance companies.....	16,664 44
Total.....	\$176,828 79

Railroads.—On the 31st of July, 1882, there were in Vermont 858 miles of main line and branches, and 88 miles of sidings, etc.

Savings-Banks.—The following is a statement of deposits in each savings-bank and trust company in Vermont, Jan. 1, 1884:

NAMES.	
Burlington Savings Bank.....	\$1,454,111 95
Burlington Trust Company.....	221,099 00
Bellows Falls Savings Institution.....	596,596 20
Brattleboro Savings Bank.....	925,115 79
Bradford Savings Bank and Trust Company..	302,723 43
Bennington County Savings Bank.....	173,433 65
Farmers' and Mechanics' Trust Company....	808,837 05
Jamaica Savings Bank.....	135,356 39
Marble Savings Bank, Rutland.....	163,258 85
Montpelier Savings Bank and Trust Company.	740,121 73
Northfield Savings Bank.....	273,597 57
Ottawaquechee Savings Bank, Woodstock.....	343,416 17
Passumpsic Savings Bank, St. Johnsbury....	1,240,000 00

NAMES.	
Rutland Savings Bank.....	\$1,514,190 10
Rutland Trust Company.....	126,835 00
Richford Savings Bank and Trust Company..	52,101 88
Springfield Savings Bank.....	404,804 42
State Trust Company, Rutland.....	367,032 61
Vermont Savings Bank, Brattleboro.....	2,045,482 98
Wilmington Savings Bank.....	252,276 88
Winooski Savings Bank.....	186,466 21
Winham County Savings Bank, Newfane....	365,945 30
West Fairlee Savings Bank.....	80,210 54
Windsor Savings Bank.....	602,495 07
Total.....	\$18,421,678 14

The number of depositors is about 45,000.

Schools.—The following are the school statistics for the year ending March 31, 1883:

School districts	2,880
Public schools	2,568
Average number of days of school in the year...	131
Pupils enrolled in the public schools	73,842
Average wages per week for male teachers	\$3 12
Average wages per week for female teachers.....	\$4 88
Total revenue for school purposes	\$543,610 45
Total expenditure for school purposes.....	\$558,289 54
Appropriations to normal schools.....	\$7,620 00

VEUILLOT, Louis, a French journalist, born at Boynes, Loiret, in 1813; died in Paris, April 7, 1893. His father removed to Paris and opened a wine-shop, and Louis, at the age of thirteen, was placed in an attorney's office. The attorney's wife took an interest in him and excited his literary ambition, and when he was nineteen, M. Thiers, then Minister of the Interior, engaged him to defend the Orleans government in the semi-official organ at Rouen. His polemic talent was at once recognized, and in the following year he was made editor of the similar journal at Périgueux, and in 1837 was summoned to Paris to write for "La Charte," which he left to take the chief-editorship of "La Paix." At this period he bore the reputation of a free-lance, actuated simply by professional ambition and government pay, to write in the cause of his employers with a vehemence and acerbity which involved him in several dueling affairs. This circumstance, in conjunction with certain intrinsic qualities in his style, always suggested a doubt of the perfect sincerity of the opinions he upheld during the rest of his life. In 1838 he visited Rome with a friend, and was so impressed with the religious pomps of holy week and the reverend majesty of Pope Gregory's manner, that he returned a devoted Catholic. His life, as well as his writings, bore witness to his conversion. He published in the next two years several books of meditation, romance, travel, and poetry. Accompanying Gen. Bugeaud to Algeria, he wrote a volume on the "French in Algeria," interspersed with religious philosophy. He was appointed, on his return, chief of a bureau in the Ministry of the Interior, but resigned to become one of the editors of "L'Univers." He soon took the management of the paper, and made it the chief organ of the clericals. For attacks on the University he was sentenced to a term of imprisonment. All the changes effected by the Revolution of 1789 he condemned, taking the extreme ground in favor of absolute monarchy by divine right.

The Revolution of 1848 was hailed by him as ushering the return of theocratic absolutism. The pamphlets entitled "Les Libres-penseurs," "L'Esclave Vindex," "Le Lendemain de la Victoire," "Petite Philosophie," and "La Legalité," written between 1848 and 1852, are masterpieces of style. While the bishops were disputing as to which of the ancient classics were improper for the study of youth, Veuillot argued vigorously in favor of relegating to oblivion the entire heathen literature. The Archbishop of Paris warned his flock against such extreme views, whereupon Veuillot posted off to Rome and obtained, through the general of the Jesuits, an apostolical letter, ordering the prelate to make peace with the "illustrious Paladin of the Church." Napoleon III, instigated by the Gallican clergy, finally suppressed "L'Univers" in 1861, and forbade other journals to print contributions from Veuillot, who again sought revenge at the hands of Pius IX, but could not induce the Pope to quarrel with his political ally. Six years later Napoleon had need of a brilliant polemic to defend the threatened temporal power of the Pope. When "L'Univers" reappeared, it waged a fierce war against the Gallican clerics for not upholding the Syllabus. At the Ecumenical Council, Veuillot was the only layman present. After the fusion at Frohsdorf, when the royalist politicians claimed to have persuaded Henry V to renounce the white flag and accept a constitution, Veuillot showed himself more royalist than the King by declaring that he no longer deserved the support of good Catholics. Veuillot insisted on identifying the restoration of the power of the Pope with the royalist cause, on which account his paper was repeatedly suspended during the septennate of MacMahon. Of his numerous published books of fiction, philosophy, history, etc., all of them stamped with his extreme religious views, the most remarkable is "Les Odeurs de Paris," a terrible satire, denouncing the corruption of manners under the third empire. As a writer, Veuillot ranks among the greatest masters of French prose.

VIRGINIA. State Government.—The following were the State officers during the year: Governor, William G. Cameron, Readjuster; Lieutenant-Governor, John F. Lewis; Secretary of State, William O. Elam; Treasurer, David R. Revelly; Auditor, S. Brown Allen; Second Auditor, Henry H. Dyson; Attorney-General, Frank S. Blair; Superintendent of Public Instruction, Richard R. Farr; Commissioner of Agriculture, James M. Blanton; Superintendent of the Land-Office, J. W. Brockenborough; Railroad Commissioner, George A. Martin. Court of Appeals: Chief-Justice, Lansford L. Lewis; Judges, R. A. Richardson, T. T. Fauntleroy, B. W. Lacy, and D. A. Hinton.

Political.—Although the November election of this year did not include any general State officer, but was confined to members of the Legislature (half the Senate and the entire

House), it aroused unusual interest, and led to one of the most heated canvasses in the history of the State. The Democrats had determined to wrest the State from the control of the Readjusters led by Senator Mahone, and to place it securely in the Democratic column in the next presidential election. Their State Central Committee met in February, and determined to call a convention to meet at Lynchburg on July 25th. The convention met at the appointed time and place, every county being represented except Buchanan, Lancaster, Lee, and Wise. A committee on party organization was appointed, which after deliberation reported in favor of electing the chairman of the State Committee by the convention, who should be *ex officio* chairman of the Executive Committee, that the State Committee should consist of five members from each congressional district, and the Executive Committee of five members chosen by the State Committee. The report also defined the duties of the State Committee, and laid down a detailed plan for organization in each congressional district, senatorial district, county and city and ward district, and for listing the voters of every precinct; and, in fact, contemplated the most exact and searching enrollment and instruction of the voters of the State. A committee for each precinct was provided. In several places the word "assessment," referring to collections from voters, appeared. Objection was made to this, but it was allowed to stand, and the report was adopted. John S. Barbour, believed to be the best organizer in the State, was elected chairman of the State Committee.

The platform opposed increase of taxation; accepted as final the recent settlement of the State debt; favored abolition of internal revenue; favored tariff for revenue; favored free education; opposed mixed schools; demanded civil-service reform; and denounced "bossism" and "ring rule."

A Straightout Republican Convention, attended by about one hundred delegates, was held in Richmond, August 15th, and pronounced against the Readjusters. The election resulted in a decisive Democratic victory. The Legislature was constituted as follows: Senate—Democrats, 24; Coalitionists,

12; vacant seats, 4; total, 40. House—Democrats, 65; Coalitionists, 35; total, 100.

The vacancies were caused by the resignation of Readjusters after the election.

Subsequently, a sufficient number of Readjusters or Coalitionists were unseated on contests to give the Democrats a two-third vote in each House. The aggregate popular vote was as follows: Democratic, about 145,000; Readjuster, about 127,000. In 1881 a Readjuster Governor was elected by a vote of 113,478 to 100,758 for the Democratic candidate. The following was the vote in 1882 for Congressman-at-large: Readjuster, 99,992; Democratic, 94,184; Straightout Republican, 4,342. The election did not pass off without violence. The most serious affray occurred at Danville, just prior to election-day, and resulted in the death of several negroes. The Readjusters claimed that it was instigated by the Democrats to intimidate the colored voters and prevent them from going to the polls, and that it had that effect.

Legislative Session.—The Legislature convened on December 5th, and was in session at the close of the year. State officers for the term beginning in January, 1884, were chosen, but no considerable legislation had been perfected.

Public Revenue.—The Governor, in his message, says:

Notwithstanding the interception by coupons between the tax-payer and the treasury of more than a half of a million of dollars, the sum remaining to the credit of the Commonwealth on Oct. 1, 1882, was \$551,540.51. During the year ending Oct. 1, 1883, there has been paid, on account of interest on the public debt, \$312,985.17, and the balance on hand in the treasury as of that date to the credit of all funds was \$1,537,204.88. This sum will be increased by several hundred thousand dollars during the current month, but the amount available for general purposes is subject to deduction in the sum of \$200,000 yet remaining to the credit of the school fund as by proceeds appropriated, but yet unexpended, of the sale of the State's interest in the Atlantic, Mississippi, and Ohio Railroad. During the period commencing on Jan. 1, 1882, the floating debt of the State has been practically extinguished.

The Governor recommends the passage of a law for the regulation of railroads, similar to those of California and Georgia.

W

WAGNER, Richard, a German composer and dramatist, born in Leipzig, May 22, 1812, the youngest of nine children, died in Venice, Feb. 13, 1883. His father, a petty official, died the same year that Richard was born. His mother married Ludwig Geyer, an actor and painter, who also died when Richard was seven years old. When eleven years of age he attempted to write tragedies after the model of Shakespeare. In school he showed no application, but he studied music by himself, and, when sixteen years old, persuaded his family

to give him a musical education. Yet, instead of applying himself to study, he attempted to write overtures, one of which was produced in the Leipzig Theatre. Then he attended lectures on philosophy and aesthetics, but he was not more diligent than before, and for a time led a wild student's life, until he became disgusted with dissipation. This was his turning-point. He took up the study of music again, and, under the teaching of Theodor Weinlig, soon became proficient in counterpoint. His teacher, who was the leader of the Gewandhaus or-

chestra in Leipzig, produced in 1838 an overture and a symphony. The symphony was played also in Prague, but the score was lost by Mendelssohn, who came in 1834 to direct the Gewandhaus concerts, and was not found until fifty years later. On a visit to his brother Albert, an opera-singer and manager in Würzburg, Wagner was encouraged to attempt an opera in Weber's style. The libretto of this romantic opera, "Die Feen," he adopted from a dramatization by Gozzi of an Indian myth. He could induce no manager to produce his work, and complained that French and Italian music had driven German art from the stage.

This experience and the success of Wilhelmine Schröder-Devrient as Romeo, in Bellini's insignificant opera, induced him to adopt for a time the style of the Parisian opera, and seek to combine the highest qualities of French and Italian music. "Rienzi" was composed under this impulse. Wagner was carried away with the ideas of the July revolution as developed in "Young Germany." He associated intimately with Heinrich Laube, and was influenced by the materialistic tendencies of that school, as well as imbued with their revolutionary and democratic ideas, to which he remained true all his life. "Das Liebesverbot," a frivolous adaptation of Shakespeare's "Measure for Measure," showed the influence of the materialistic thought and of the artificial French musical taste then prevailing.

In 1834 the young composer became director in the Magdeburg Theatre, which failed two years later. Here he fell in love with the actress Wilhelmine Planer, whom he married in Königsberg, where he was employed in 1836. He next obtained an engagement in Riga. Here he wrote the text and part of the score of "Rienzi," and determined to give his genius free rein and seek recognition in the musical capital of the world as a composer of grand opera. When his contract expired he embarked with his wife for Paris. The conception of "Der fliegende Holländer" took form during the long and stormy voyage. He was received with kindness by Meyerbeer, but for the presentation of "Rienzi" there was no chance. Put off with promises, he supported himself miserably by letters to German newspapers and musical critiques. The text of the "Flying Dutchman" he sold to a manager who had the score written by an insignificant composer and produced it without success. Wagner was at last reduced to work for the musical publishers, adapting for the piano selections from Halévy's operas.

He returned to Germany in April, 1842. "Rienzi" was accepted in Dresden, and Ti-

chatchek (Schröder-Devrient) was persuaded to take the principal rôle. The music of the "Fliegende Holländer" was written in seven weeks at Meudon in 1841. This opera was offered at Munich and Leipzig, but was refused with the excuse that it was not adapted to German taste, but by the influence of Meyerbeer it was brought out at Berlin. It, and an incomplete Faust symphony, written in Paris under the inspiration of Beethoven's Ninth Symphony, were the first works produced in Wagner's own manner. The success of "Rienzi" was complete, and spread the fame of its author and composer through Germany.

RICHARD WAGNER.

He was engaged as a conductor in the Court Theatre at Dresden, and then received the appointment of court chapel-master, an office which he unwillingly assumed, forced by pecuniary difficulties, arising from losses incurred in the publication of his works. When the "Fliegende Holländer" was given in Dresden, Wagner was disappointed to find that his later and more characteristic style was not appreciated. "Rienzi" kept the stage only in Dresden, for the lack of singers who could take the title-rôle elsewhere. During the next two years he was occupied with "Tanhäuser," in which he followed his artistic inspirations regardless of his experience with the "Fliegende Holländer." He next worked

out the comic opera of the "Meistersinger." "Lohengrin" was matured about the same time, and "Parsifal" was conceived. When "Tanhäuser" was produced in 1845, the public was dissatisfied at the depressing effect of the drama and the unfamiliar musical effects. Even the singers rebelled at the extraordinary demands made upon their vocal powers, which after all did not please the public. A controversy between the critics ensued, and lasted many years. Dramatic art, it was argued, should aim to leave pleasing impressions, and the musical drama should have plenty of melody. The "Meistersinger" was instanced as containing no airs at all. Wagner was represented by these critics as wasting his genius on vain theories, though the theories were mostly of their own invention. "Tanhäuser" gradually became popular, when the public got used to Wagner's original style, and found that it contained melody of the purest quality. Every one of Wagner's operas had to undergo the same probation. For ten years no theatre was willing to give "Tanhäuser" a representation, except Wagner's own in Dresden, where it slowly won popular approval. Wagner's material circumstances constantly grew worse; yet he still remained true to his art, and proceeded with the composition of the words and music of "Lohengrin." Although incapable of enjoying his productions, the people of Dresden prized Wagner as the greatest of operatic directors. He selected none but the highest products of German musical genius, and subjected the text and instrumentation to a thorough revision. His method of presenting Gluck's operas, in particular, became the model which is everywhere followed. Even more famous was the rendition under his direction of classic orchestral works, particularly the Beethoven symphonies of the royal chapel band. The management of the opera-house, discouraged by the mere *succès d'estime* of "Tanhäuser," and disinclined at the cost of the mounting which Wagner insisted upon, delayed putting the piece on the boards until the composer felt the neglect. A scheme which he advocated for the establishment of a Saxon national theatre was disregarded.

When the outbreak of May, 1849, occurred, Wagner took an active part in the insurrection. He arranged the signals with church-bells, organized the arrival of bands from outside, and delivered fiery revolutionary speeches. After the suppression of the revolution he escaped from prison by hasty flight, and became a political refugee. He settled at Zürich, and first turned to the pen as a means of support, writing three important and characteristic books, entitled "Art and Revolution" (1849), "The Art of the Future" (1850), and "Opera and Drama" (1851). Franz Liszt, soon after receiving the appointment of chapel-master to the Grand Duke of Weimar, became the first applicant for "Tanhäuser" in 1848. Wagner, when in his flight he saw the representa-

tion at Weimar, declared that Liszt was his *alter ego*. Liszt now took up "Lohengrin" and made it a success, after which he wrote Wagner that he should create a new work. Though he composed no music between 1849 and 1853, he became immersed in the dramatic reproduction of the Germanic mythology. "Siegfried's Tod" was already finished in 1848. He felt impelled to proceed with the dramatization of the rest of the story of the "Nibelungenlied," corrected by the study of the "Edda." In 1853 Wagner printed his poetical work on this subject, in order to acquaint his friends with the musical task he had undertaken. Liszt was the only one who did not lose courage. In order to render possible the realization of an artistic project so unusual and formidable, he proposed a national prize, with the obligation to present the crowned work, and, when this was rejected, attempted to have a grand festival theatre built in Weimar. When Wagner had completed "Rheingold," "Walküre," and the two first acts of "Siegfried," he stopped, discouraged and exhausted. His next work was "Tristan und Isolde," in which the development of his style had proceeded so much farther, and his demands on the technical theatrical art were so much greater, that no theatre would undertake its representation. Wagner determined to make another appeal for recognition to the wealth and taste of Paris. His plan was to collect a German troupe to represent his operas. He was obliged to abandon this project, but in concerts he presented fragments of his works, won friends and admirers, and succeeded in having "Tanhäuser" presented in the Grand Opera-House. Anti-German feeling was already rife in Paris, and fashionable rowdies conspired to destroy the chances of the opera. The performance was interrupted by hisses and ejaculations, and not allowed to be finished. The same year (1861), through the intercession of the Grand Dukes of Weimar and Baden, he was arrested and permitted to return to Germany. Efforts of his friends to obtain him a place were fruitless, from the fear of operatic managers that with his services they would have to accept his operas and their impossible conditions. For some years he presented fragments of his uncompleted great work in concerts throughout Germany and Europe. In Russia he earned a great deal of money, and in London and other cities he gained reputation, but the prospects of his operas were gloomier than ever. He offered to write a new piece for the Vienna company, but received a cool refusal.

At length, in 1864, to his greatest astonishment, he received an invitation from the young King of Bavaria to come and complete his Nibelung series. His first movement after his arrival in Munich was to bring out the oft-rejected "Tristan und Isolde," in 1865, with such success that his friends came from all over the world to witness the triumph. Hans von Bülow was called from Berlin to direct

the orchestra. Under his and the master's training, with artists selected and schooled for effects never attained before with the human voice, and possessing dramatic talent of a high order, with scenery and costumes in which expense was not spared, with stage-machinery invented for the purpose, with instruments of new designs, Wagner's operas were placed on the stage, one after the other, as no operas had ever been. In 1868 the "Meistersinger" was brought out, and even this extreme example of the "music of the future" became a popular favorite. Wagner was resolved that the Nibelung cycle, if ever produced at all, should be presented in a special theatre, and not left to its fate on the regular stage. For this purpose the Wagner Union was founded, and in 1872 the corner-stone of an opera-house in Bayreuth was laid. The completion cost far more than was expected, and the deficiency was made up from the private purse of King Louis. Wagner intended to found a school of operatic art in connection with the monumental theatre. In order to carry out the project, he was obliged to allow the Nibelung cycle to be played in ordinary theatres, and, singularly enough, the managers of Germany, one after another, introduced it in their repertoires. The great work was presented in Bayreuth in 1876. Richard Wagner's last work was "Parsifal." Wagner separated from his first wife, after living with her twenty years, and subsequently married Cosima, Liszt's daughter, the divorced wife of Btlow.

WASHINGTON TERRITORY. The Governor during the year was William A. Newell; Secretary, N. H. Owings. Present population, estimated at 125,000.

Legislative Session.—The Legislature met on October 2d, and adjourned on November 28th. Among the acts passed were the following:

To establish and provide for free scholarships in Territorial University.

To change the time of convening the Territorial Legislature.

Memorials praying for various river improvements. Memorial for the admission of Washington Territory to the Union.

Memorial to abolish Indian reservations.

Consolidating New and Old Tacoma.

Creating the counties of Skagit, Douglas, Kittitas, and Lincoln.

Prohibiting hogs from running at large.

Relative to inspection and measurement of logs.

In relation to drift saw-logs.

To secure for the owners of live-stock payment for injuries sustained by railroad-trains.

For the inspection and ventilation of coal-mines.

In relation to habitual drunkards.

Submitting to electors the question of taxing church property.

Prohibiting the sale of pistols and tobacco to children under sixteen years of age.

To preserve and protect school lands.

Relative to liens on rolling-stock of railroads.

An act was also passed extending the right of suffrage to women. A memorial was introduced for the creation of a separate Territory from eastern Washington and northern Idaho, but it failed to pass.

Finances.—The total receipts for two years

ending Sept. 30, 1888, including balance, were \$156,016.27; disbursements, \$127,708.44.

The total valuation of property in the Territory in 1882 was \$32,568,901. In 1888 it was \$44,107,567.

Penitentiary and Insane Asylum.—The Penitentiary at Seacoo contains 73 persons. The cost of their maintenance for the past two years has been \$38,000.

The Insane Asylum is near Steilacoom. The number of patients, Aug. 15, 1888, was 129. The expenditures for two years were \$57,106.52, which includes repairs and improvements to the amount of \$7,889.18.

Education.—The public-school statistics for the year ending Aug. 31, 1888, are:

Of school age, between 5 and 21.....	32,000
Pupils enrolled.....	24,000
School districts.....	700
School-houses.....	700
Teachers employed.....	650
Graded schools.....	15
Average length of schools in months.....	4½
Paid to teachers.....	\$97,000 00
Paid for buildings.....	\$60,000 00
Paid for furniture and apparatus.....	\$20,000 00

Amount paid for school purposes..... \$177,000 00

Indians.—Thirteen thousand Indians occupy fifteen reservations, which contain seven millions of acres of the best agricultural, grazing, timber and mineral lands of the Territory, using them variously for hunting, fishing, farming, and strolling; besides the use of which, they receive liberal assistance from the Government in the guardianship of agents, the benefit of physicians, medicines, hospitals, schools and teachers, with donations for food, clothing, and implements for forest and land.

Statehood.—On the subject of the admission of the Territory, Gov. Newell says:

Our ability to sustain a State government and our claim to admission based upon resources and population—which are the only reasonable requirements—are conceded. Our people are quite unanimously in favor of the measure, desiring to be possessed of the rights and privileges exercised by other American citizens. If there be any doubt as to the population required to entitle us to a member of Congress, a new census would solve the question.

The people of the Territory have already adopted a State Constitution preparatory to admission, which instrument is generally regarded as being too voluminous and cumbersome, containing many provisions which might properly be embodied in statutory enactments, and others not adapted to our present and advanced requirements.

Northern Pacific.—The completion of the Northern Pacific Railroad from Lake Superior to Puget Sound is an event of vast importance to the Territory of Washington. The Governor says:

Forty-five millions of acres of timber, coal, pasture, and mountain lands, mines of precious metals, quarries of lime, stone, marble, granite, slate, and stone, and beds of mica; ocean front and inland salt seas; many lakes and rivers affording thousands of miles of navigable waters, all alive with a hundred varieties of fish, some of them of great value: water-powers; a climate of even temperature and healthful; grand scenery of water and mountains, facilities for manufacturing the staples from our own material, wood,

iron, wool, and hides; maritime opportunities unsurpassed for internal, coastwise, and foreign commerce; in a line to absorb the trade of Alaska in fish, fur, cedar, and gold; to obtain the largest share from Asia in coffee, teas, opium, porcelain, silks, and ivory—all of these are our resources and advantages.

Political.—In 1882 Thomas H. Brents, Republican, was elected delegate to Congress by a vote of 11,252, against 8,244 for his Democratic opponent. The Legislature of 1883 consisted of 6 Democrats and 6 Republicans in the Council, and 14 Democrats and 10 Republicans in the House.

WEST INDIES. British.—The Governor of the Bermudas is Lieut.-Gen. T. L. Gallway; of Barbadoes and the Windward Islands, W. Robinson.

Jamaica.—After the negro rising in Jamaica in Gov. Eyre's time, fifteen years ago, the parliamentary government of the island was abolished, and the colony became what is called a crown colony, ruled by officials appointed by the Colonial Office in London. An influential party in Jamaica now claims that the condition of the island is so much changed that it is time to reinvest the people with self-government.

The shipments to the United States amounted during the six fiscal years, 1877 to 1882, to \$284,650 from Kingston, and \$520,446 from Port Antonio; of oranges from Kingston, to \$429,575; of cocoa-nuts from Port Antonio, to \$148,545, besides moderate amounts of limes, pineapples, and mangoes. The latter, now perhaps the most common fruit in Jamaica, is of comparatively recent introduction.

The Bahamas.—The cultivation and shipment of pineapples is the most important industry of the Bahamas. The vessels engaged in this trade are mostly schooners of from 75 to 150 tons, noted for speed, and able to make the run from the islands to Baltimore, Philadelphia, and New York, in from four to eight days, more than two thirds of them being New England fishing-vessels and Baltimore pungies. There were shipped to the United States in 1882 something over 100 cargoes, mostly in American bottoms, amounting to 462,000 dozen, worth \$141,000. There was also a marked increase in the shipments of preserved pineapples, \$43,000 worth, against \$32,800 in 1881. In the item of sponges the increase has been very marked, a brisk trade continuing all through the year 1882. In 1881 there were shipped to the United States 284,529 pounds; value, \$118,648. In 1882 the amount was 464,748 pounds, valued at \$190,752.

Dominica.—During the night from Sept. 4 to Sept. 5, 1883, the island, for the first time since 1884, was visited by a terrific hurricane, causing destruction to the extent of half a million pounds sterling. This hurricane also struck Porto Rico and other West India islands, but it nowhere proved so disastrous.

The shipments of produce from the British West Indies to the United States, during the first half of the year 1883, were:

The Bahamas	\$314,400	Nevis	\$2,000
The Bermudas	875,000	Barbadoes	1,372,000
Antigua	267,000	Jamaica	675,000
Dominica	56,000	Trinidad	2,223,141
Montserrat	18,000	Turk's islands	60,000
Total			\$5,278,541

The principal products imported into the United States from British Honduras during the fiscal year 1882 were: Coffee, 829,604 pounds; India-rubber, 161,288 pounds; and sugar, 2,867,905 pounds.

The chief product imported from British Guiana into the United States is sugar, and next to it molasses. Sugar importation has of late years increased as follows:

	Pounds.		Pounds.
1875	87,485,370	1881	47,531,626
1879	13,074,878	1882	64,457,636
1880	84,073,788		
Total			196,561,742

Danish.—The Danish West India colony consists of three islands forming the extreme western group of the Virgin islands. *St. Croix*, commonly called *Santa Cruz*, measures 218 square kilometres; *St. Thomas*, 86; and *St. John*, 54; together, 858, or 188 square miles. The total population is 83,763.

St. Croix is called the garden of the West Indies; it is fertile, every foot almost is cultivated, and it produces the best grade of muscovado sugar. *St. Thomas* and *St. John* produce little sugar, and hardly anything besides.

St. Thomas is a free port, and has a roomy harbor, with facilities for the repair of vessels.

The American trade with the Danish West Indies has been as follows:

FISCAL YEAR.	Import into the United States.	Export of domestic merchandise from the United States.
1880	\$461,497	\$639,194
1881	359,900	721,139
1882	589,024	716,591
1883	884,003	694,565

Dutch.—The West India possessions of the Netherlands cover an area of 1,130 square kilometres, and consist of the following islands:

ISLANDS.	Area, square kilometres.	Population.
Curaçoes	550	24,506
Bonaire	225	5,000
Aruba	165	6,128
St. Martin's (Dutch portion)	21	3,226
St. Eustatius	47	2,256
Saba	13	2,208

The colony of Surinam, or Dutch Guiana, in South America, measures 119,321 square kilometres, and has a population of 69,856; its capital is Paramaribo, with 27,416 inhabitants.

The island of Curaçoa is a free port, and has been till latterly a sort of entrepot for Dutch colonial trade with Venezuela.

The American trade with the Dutch West Indies in the past five years has been as follows:

FISCAL YEAR.	Import into the United States.	Export of domestic goods from the United States.
1879.....	\$647,409	\$692,171
1880.....	1,255,517	837,938
1881.....	2,594,376	921,475
1882.....	1,582,133	743,304
1883.....	832,053	579,690
Total.....	\$7,061,486	\$3,708,927

French.—The French West Indies consist of the island of Martinique on the one hand, and of Guadeloupe and dependencies, Les Saintes, Marie-Galante, St. Martin, and St. Barthélemy or St. Barts, on the other. Martinique has an area of 988 square kilometres, while Guadeloupe and dependencies measure jointly 1,870. The population of the former is 166,100, and of Guadeloupe and dependencies 192,785.

Martinique.—Sugar-making has increased notably both in Martinique and Guadeloupe of late years, due to the introduction of central sugar-houses, perfected machinery, and the latest improved processes. In 1880 there were under cane-culture in Martinique 19,364 hectares, of 2½ acres, producing 41,820 tons sugar of 2,240 pounds, worth 19,320,000 francs; 1,326,000 litres molasses (100 litres = 22 gallons), worth 265,000 francs; and 9,170,000 litres of rum, worth 3,209,000 francs. Sugar had pretty much superseded all other agricultural products. The aggregate value of landed property in the island was 78,000,000 francs.

Guadeloupe.—In 1880 Guadeloupe turned out 49,982 tons of sugar, worth 81,666,000 francs; 4,580,000 litres of molasses, worth 1,145,000, and 2,842,000 litres of rum, worth 2,274,000 francs; 865 tons of coffee, 21 of cotton, 108 tons cocoa, and 4,000,000 francs' worth of cereals and vegetables, besides 566 tons of annatto. In 1881 Guadeloupe exported to France 21,446,095 francs' worth of produce, and imported thence 15,770,070 francs' worth of merchandise.

The sugar importation from the French West Indies into the United States is shown in the following:

	Pounds.		Pounds.
1878.....	65,528,322	1881.....	59,964,077
1879.....	70,551,547	1882.....	59,952,540
1880.....	70,028,988		
Total.....			326,020,274

During the fiscal year 1883 the United States imported from the French West Indies \$2,895,857 worth of products, and exported thither \$1,783,322 worth of domestic merchandise.

Guiana.—French Guiana, commonly called Cayenne, is a penal colony in South America. It has an area of 121,418 square kilometres, and 27,333 inhabitants. The subject of predominant interest in the colony in 1883 was the change in the methods employed for working the gold-fields. Instead of confining the search for the precious metal to placer or surface mining, a shaft has been sunk on the St. Elie placer, and a quartz-mill erected. The French mining-engineer, M. Nibaut, says: "Gold-mining is

at present the chief and, it may even be said, the only source of wealth in the country. The local authorities have made grants to work the auriferous region to the extent of 10,000,000 hectares, although only 2,000,000 hectares of surface in the colony really contain any gold. For these concessions the colonial government collects annually, from the parties to whom the privilege of working the mines is granted, half a franc per hectare; it levies besides a tax of 5 per cent. on the gold extracted, and 8 per cent. export duty."

American Trade.—The American trade with French Guiana has been as follows:

FISCAL YEAR.	Import into the United States.	Export of domestic goods from the United States.
1879.....	\$15,759	\$69,387
1880.....	3,273	73,645
1881.....	3,108	63,762
1882.....	18,458	97,677
1883.....	18,487	101,018
Total.....	\$39,054	\$409,934

WEST VIRGINIA. State Government.—The following were the State officers during the year: Governor, Jacob B. Jackson, Democrat; Secretary of State, Randolph Statnaker, Jr.; Treasurer, Thomas O'Brien; Auditor, Joseph S. Miller; Superintendent of Free Schools, Bernard L. Butcher; Attorney-General, C. O. Watts. Court of Appeals: President, Okey Johnson; Judges, Thomas O. Green, Adam C. Snyder, and Samuel Woods.

Legislative Session.—The Legislature convened on the 10th of January, and adjourned on the 23d of February. On the 23d of January, John G. Kenna, Democrat, was elected United States Senator by a vote of 58 to 28 for George G. Loomis, Republican, and 5 for John Y. Jarney, Greenbacker. Among the acts passed were the following:

To suppress prize-fighting; to prohibit the obstruction of the public streams of this State by felling and leaving timber in the same; to authorize railroad corporations to become surety for or guarantee the debts of railroad companies; imposing a tax of twenty-five cents on the one hundred dollars valuation of all real and personal property not exempt from taxation, for general purposes, for the year 1883; providing for the keeping of ropes, wire-ladders, or other proper fire-escapes, in all rooms above the second floor in all hotels and taverns; establishing "Scribner's rule" as the lawful rule for the measurement of lumber, logs, and timber of all kinds; regulating the working and proper ventilating and drainage of coal-mines, and providing for the appointment of a mine inspector; for the appointment of a commission to ascertain the facts concerning and to consider the assessment and taxation of property in this State, with a view to the revision of existing laws.

A joint resolution was adopted striking out section 7 of Article IV of the Constitution, and inserting in lieu thereof the following:

The general elections of State and county officers, and of members of the Legislature, shall be held on the Tuesday next after the first Monday in November, until otherwise provided by law. The terms of such officers, not elected, or appointed to fill a vacancy,

shall, unless herein otherwise provided, begin on the first day of January; and of the members of the Legislature on the first day of December next succeeding their election. Elections to fill vacancies shall be for the unexpired term. When vacancies occur prior to any general election, they shall be filled by appointments, in such manner as may be prescribed herein, or by general law, which appointments shall expire at such time after the next general election as the person so elected to fill such vacancy shall be qualified.

This proposed amendment is to be submitted to the people at the general election in 1884. If it shall be adopted, it has been questioned whether in 1884 there will not have to be two elections—one in October under the old provision, and a second in November under the new. A prohibitory amendment passed the House by a vote of 49 to 14, but it was rejected in the Senate by a vote of 15 to 11.

Congressional Districts.—The following are the new Congressional Districts, formed in 1882:

1. Braxton, Brooke, Doddridge, Gilmer, Hancock, Harrison, Lewis, Marshall, Ohio, Tyler, and Wetzel counties.

2. Marion, Monongalia, Preston, Taylor, Barbour, Randolph, Tucker, Pendleton, Grant, Hardy, Mineral, Hampshire, Morgan, Berkeley, and Jefferson.

3. Boone, Clay, Fayette, Greenbrier, Kanawha, Logan, Mercer, Monroe, McDowell, Nicholas, Pocahontas, Raleigh, Summers, Upshur, Webster, and Wyoming.

4. Mason, Pleasants, Ritchie, Wirt, Jackson, Wood, Calhoun, Roano, Putnam, Cabell, Wayne, and Lincoln.

An election was held in the third district on May 15th to fill the vacancy caused by the resignation of Mr. Kenna, elected to the Senate. The following was the result: Charles P. Snyder, Democrat, 9,621; J. H. Brown, Republican and Greenbacker, 8,391. The vote in 1882 was: Democratic, 10,279; Republican, 5,814; Greenback, 1,454.

Finances.—The estimated receipts for the fiscal year ending Sept. 30, 1884, are:

For the State fund.....	\$395,850 00
Add balance (estimated) on hand.....	14,465 40
Total.....	\$410,315 40
The estimated charges for that year are.....	388,700 69
Leaving a balance of.....	\$21,614 71

The assessed value of personal property in 1881 was \$37,562,854; of real estate, \$105,448,502.87.

Education.—The total value of school property in 1882 was \$1,823,987.16; whole number of school-houses, 3,889; number of teachers employed, 4,860.

The catalogue of the State University for 1881-'82 shows an increase of students over former years, the number being 177.

WISCONSIN. State Government.—The following were the State officers during the year: Governor, Jeremiah M. Rusk, Republican; Lieutenant-Governor, Samuel S. Fifield; Secretary of State, Ernst G. Timme; Treasurer, E. C. McFetridge; Attorney-General, Leander F. Frisby; Superintendent of Public Schools, Robert Graham; Insurance Commissioner, P. L. Spooner; Railroad Commissioner, Nils P.

Hanger. Judiciary, Supreme Court: Chief Justice, Orsamus Cole; Associate Justices, William P. Lyon, Harlow S. Orton, David Taylor, and John B. Cassady.

Legislative Session.—The Legislature convened on January 10th, and adjourned on April 4th.

The following is a brief outline of the most important business session:

The 14th judicial circuit was created out of the 10th. The income of the State University was increased by about \$13,000 per annum. The county of Sawyer was created out of portions of Ashland and Chippewa, and Washburn from a portion of Burnett. A bill was passed allowing two or more continuous railway lines running to a particular point to consolidate; this is a scheme for the especial benefit of the Northwestern and Omaha lines. A bill went through allowing the St. Paul Railway Company to issue stock on any lines heretofore or hereafter purchased, or on coal lands purchased by it. Another railway bill allows companies to condemn lands for spur tracks running to mills and warehouses. A very stringent tramp law was passed, providing for the incarceration of vagrants for one year in the State prison. A bureau of labor statistics was created. The following villages were incorporated as cities: Kewaunee, Menomonie, Marshfield, Hartford, De Pere, Tomah, Sparta, Merrill, Edgerton, Sturgeon Bay, Black River Falls, Nicolet, Geneva, Mauston, and Colby. The bill regulating the dealing in futures was passed.

The direct appropriations of the session amounted to \$573,470.71, of which the sum of \$523,800 was for the charitable, reformatory, and penal institutions. The tax-law provides that a State tax of \$110,000 shall be levied upon the taxable property of the State of Wisconsin for the year 1883, and a State tax of \$240,000 shall be levied upon the taxable property of the State of Wisconsin for the year 1884, in addition to all other taxes and charges authorized to be levied for each year aforesaid.

Finances.—The following were the balances at the close of the month of December, 1883:

General fund.....	\$432,739 22
School fund.....	23,403 84
School-fund income.....	23,201 50
Normal School fund.....	52,249 05
Agricultural College fund.....	3,043 50
Drainage fund.....	30,337 54
Delinquent tax fund.....	1,804 33
Deposit fund.....	11,225 23
Redemption fund.....	157 06
St. Croix L. S. E. R. trespass fund.....	26,738 18
St. Croix L. S. E. R. deposit fund.....	438 02
Wisconsin farm mortgage fund.....	6,693 61
Allotment fund.....	916 54
Total.....	\$682,279 14

Schools.—At the close of the school year, May 31, 1882, there were in the State 257,429 children between the ages of seven and fifteen years. Of these, 223,575, 87 per cent., attended public school some time during the year—an average of seventy-three days. The number of school-houses in the State was 5,808. The number of city school systems was thirty-one, and the number of school districts and sub-districts, outside of cities, 5,593. There were twelve towns maintaining the township system. There were required for all the public schools 7,098 teachers. During the year there was spent for teachers' wages \$1,487,439.19; building and repairing cost \$272,634.

68; the salaries at the State University amounted to \$48,429.40, and the Normal School salaries to \$59,642.84.

In 1879 the Legislature of the State adopted the compulsory education scheme. The attendance of the children between seven and fifteen years of age was required for at least twelve weeks in each school year.

Railroads.—The comparative tables annually prepared by the State Railroad Commissioner show that the roads which traverse Wisconsin have a total of \$157,618,520.80 of common stock, of which \$40,674,680.17 are apportioned to Wisconsin. The total of preferred stock is \$100,374,894.47; for Wisconsin, \$19,888,974.63. Total debt of whole lines, \$188,880,621.73; for Wisconsin, \$57,556,114.68. The total amount spent for construction and equipment for the whole lines during the year, not including the Northern Pacific, was \$24,838,902.61; for Wisconsin, \$8,002,066.19. The earnings for all lines in Wisconsin were, during the year: From passengers, \$5,306,176; from freights, \$18,299,305.95; from mails, express, etc., \$1,052,165.51; making the total earnings for this State \$19,706,857.84. For Wisconsin, the taxes paid by railroads from June, 1882, to June, 1883, were \$648,395.27; rentals paid, \$543,056.47; interest paid, \$3,603,390.88; dividends paid, \$1,812,128.65.

Lumber.—The report of lumber district No. 2 shows the following:

Logs scaled at the mouth of Black river.....	178,589,490 ft.
Lumber manufactured at La Crosse and immediate vicinity	144,500,000 ft.
Shingles manufactured in district.....	58,000,000
Lath.....	27,000,000

The report of district No. 11 contains the following figures: Logs scaled, 46,000,000 feet; manufactures, 49,000,000 feet; lath and shingles, 14,700,000.

WOOD, James Frederick, an American Roman Catholic prelate, born in Philadelphia, April 27, 1813; died there June 20, 1883. His parents were English, and came to America a few years before his birth. His father was a merchant and importer. After being educated in England, he went to Cincinnati, in November, 1827, and, having taken a clerkship in the United States Bank, he rose gradually, in the course of eight years, to the place of cashier. He was also for three years in the Franklin Bank of Cincinnati. Mr. Wood was of Protestant parentage, but became a Catholic, and was baptized April 7, 1836. His attention was now turned to the vocation of the priesthood, and he accordingly went to Rome in 1838, studied there for nearly seven years, and in March, 1844, was made a priest. In the autumn of that year he returned to the United States, and was appointed assistant rector of the cathedral in Cincinnati. He filled this place for ten years, when he became pastor of St. Patrick's Church in the same city. While discharging his duties as pastor he was appointed Coadjutor-Bishop of Philadelphia, with the right of succession. He was consecrated bishop April 26, 1857. The

diocese at that date included nearly all Pennsylvania, West New Jersey, and the whole of Delaware. The diocese was in a very bad condition financially, but the new bishop showed himself equal to the situation. He began at once to organize the cathedral parish, built a chapel, introduced a wider range of devotions,

JAMES FREDERICK WOOD.

gathered the people together, and discharged all the duties of a parish priest with a zeal and regularity which soon made the parish one of the strongest in the city. He gave particular attention to financial questions, and it is not too much to say that to him almost alone is due the credit of extricating the diocese from its difficulties.

On the death of Bishop Neumann, Jan. 5, 1860, Bishop Wood succeeded to the title and full administration of the diocese. In November, 1864, he consecrated his cathedral. All the charitable institutions received improvement and extension. New religious orders were introduced. He established the Home for Destitute Orphan Girls, enlarged St. Vincent's Home, aided the Sisters of the Good Shepherd, brought in the Little Sisters of the Poor, and established the Sister Servants of the Immaculate Heart of Mary. He was especially urgent in forwarding the interests of his Theological Seminary at Overbrook, near Philadelphia, the corner-stone of which was laid April 4, 1866.

In February, 1875, Pope Pius IX erected Philadelphia into a new metropolitan see, and Bishop Wood attained to the dignity of archbishop. He was invested with the pallium June 17, 1875. Bishop Wood was a firm believer in the doctrine of infallibility.

WORLD'S FAIRS. Amsterdam.—The International Colonial and General Exportation Exposition was opened in Amsterdam, Holland, May 1, 1883, and closed on October 31st. It

was organized by a syndicate of Belgian and Dutch capitalists. The foundation of the undertaking was a complete representation of the Dutch East India colonies, including the manners and customs of the natives, their systems of agriculture, transportation, and commerce, domestic arts, mechanical trades, weapons of war, types of the people, costumes, and general products. This department of the Exposition was comprised in a special building, with minor structures. The entire Exposition occupied twenty-five acres, in the suburbs of the city. Within this space were grouped the various buildings, about fifty in number. In the main building were arranged the manufactures and products of the different countries exhibiting. Of these the countries exhibiting the most fully were in this order—France, Belgium, Holland, Germany. The finest exhibit, and said to be the finest ever made by that country, was by France. The poorest was from the United States, from which country no commissioners were sent, the display made being by agents in Europe of American manufactures, and comprising only a few articles. Machinery Hall included machinery in operation from France, Germany, Belgium, Holland, the United States, and Great Britain. A special building, forming an annex to the main building, contained representations of numerous small industries and manufactures in operation, and here were disposed the greater number of those minor exhibits which are usually scattered throughout an exhibition, and which include small wares for sale and strictly for exhibition or competitive purposes. There were also separate structures devoted to special exhibitors, besides a pavilion for the city of Amsterdam, one for the King of Holland, the Press Pavilion, and numerous restaurants representing Holland, Germany, France, England, and other countries. The grounds were tastefully laid out in flower-gardens; and as the situation was intersected by canals, there was opportunity for a novel display of Chinese junka, Javanese and other East Indian boats and bridges, displaying the designs of different countries. One building was devoted to a Javanese band or orchestra, the *Gamelang*, comprising thirty-eight native performers on the musical instruments of Java, a most novel and interesting attraction. Of the entire colonial exhibit it is to be said that it was the largest, most comprehensive, and most instructive ever made. The general exhibition, while it partook of the characteristics of all such displays, was notable in having fewer insignificant and frivolous exhibits than any other. In point of size, the Amsterdam Exposition will rank next after that of Paris in 1878. The fine-art exhibits were contained in a special building, and numbered as many as 2,000 paintings of Holland, Belgium, France, Italy, Spain, Germany, and Great Britain. This display was not, as a whole, first rate in merit, though the Dutch and Belgian works presented the best speci-

mens of the artists of those countries. The principal structures were remarkably handsome, highly ornamental, and arranged to display the exhibits to the best possible advantage. Nothing could be finer, within the same limits, than the general effect of the display, nor any scene more picturesque than the grounds and the buildings, particularly the facade of the main building, constructed after an Oriental pattern, in a semicircular form, supported by two towers resting, respectively, upon the backs of four monster elephants, and surmounted by figures of Indian gods. The entrance to this was through the New Royal Museum, in which were exhibited the splendid articles from the Kensington Museum, and those brought by the Prince of Wales from India, gifts made to him by the native rajahs. An important and most interesting special exhibit was that of diamond cutting and polishing, an industry for which Amsterdam is the most famous locality in the world. The horticultural display was contained in a separate building, but was of minor importance. The Press Pavilion was an elegant structure, containing all necessary accommodations for the journalists of the world who visited the Exposition in the prosecution of their duties.

The charge for admission to the Exposition varied on different days, the highest being a florin, or forty cents. Arrangements were effected with the French and Belgian railways, by which parties of excursionists came from remote parts of the Continent at reduced prices, while the entire system of Dutch railways offered similar facilities. By these means the peasantry and farming classes were able to visit Amsterdam and the Exposition at a moderate expense, and the grounds and buildings were made peculiarly interesting by the presence of the Friesland and North and South Holland peasantry in their peculiar costumes.

The entire grounds of the Exposition were granted to its administration by the city officials of Amsterdam. As a charge for space was made to exhibitors, of fifteen florins per square metre, an enormous income was realized from this source, and the Exposition was thus organized on a profitable basis without regard to the sale of admissions. The articles exhibited, excepting in certain specified cases, were all offered for sale, and a considerable traffic was conducted in the smaller objects. The administration and general supervision were excellent, the police and sanitary arrangements entirely satisfactory.

An important feature of the Exposition was the series of conferences or scientific reunions for the discussion of topics in the arts and sciences, hygiene, political economy, international jurisprudence, etc., which were participated in by some of the leading specialists of Europe. Medals and diplomas were awarded by a carefully chosen list of juries comprising some of the leading scientists and experts of the different countries exhibiting.

The colonial exhibits were collected under the auspices of the Colonial Department of the Government, by experts sent to the East Indies for the purpose, and at the close of the Exposition these were given by the Government to the Museum of Leyden.

India, China, Japan, and the English Australian colonies were largely represented in the Exposition; Uruguay, Chili, and Brazil made also a fair display. The Dutch colony of Surinam made a fine exhibit, including types of the natives. Egypt was fully illustrated, as were also Tunis and Morocco. No more perfect and comprehensive display was ever made in any exhibition by any country, in proportion to its size and capacity, than was made by Holland at the Amsterdam Exposition. This portion of the collection was a matter of surprise to visitors, on account of its extent, and the general beauty and excellence of the exhibits. In the articles of manufacture special to Holland, the display was complete; in Schiedam gin, candles, Delft chinaware, Delft-Smyrna carpets, and pipes, this country has made a world-wide reputation. Such was also the case in regard to the Belgian exhibits of laces, carved-oak furniture, glass, metal-work, and carpets.

At the close of the Exposition, as was the case in that of Paris in 1878, a monster lottery of exhibits was organized under Government permission, the prizes being articles purchased from the exhibitors of the different countries. The official report of the Amsterdam Exposition not having been made at the time of this writing, its statistics are not accessible. In a general way, it is believed to have been, financially, more successful than any previous undertaking of the kind. The President of the Exposition was Herr D. Cordes, and the Commissioner-General, M. E. Agostini.

Boston (Mass.) Foreign Exhibition.—This exhibition differed from all that have preceded it in the United States, in being devoted exclusively to products and manufactures of foreign countries. It was organized in 1882, under the general laws of Massachusetts, by charter granted for "the general improvement of the manufacturing and mechanical interests of the United States, by means of holding worthy and adequate exhibitions of foreign manufactures, artistic and natural productions; the improvement of educational facilities afforded to artisans; the providing of foreign libraries of reference, for use at such exhibitions; the providing of lectures and discussions on subjects of industry, science, and art; and the providing of all other proper means by which these objects can be accomplished." By an act of Congress, approved June 28, 1882, all goods intended for this exhibition were admitted free of duty while on exhibition, the building being made a bonded warehouse for this purpose, and the goods permitted to be sold at the close upon payment of duty.

The exhibition was organized under the

name of the Foreign Exhibition Association, by the issue of stock to the amount of \$25,000. The officers of the association were as follow: Nathaniel J. Bradlee, President; C. B. Norton, Secretary; Frederic W. Lincoln, Treasurer. Directors—Nathaniel J. Bradlee, Frederic W. Lincoln, Frederick O. Prince, Lansing Millis, James H. Wilson, Francis A. Walker, Henry W. Peabody, William A. Hovey, Hartley Lord, S. D. Sergeant, J. W. Wolcott, Nathan Appleton, Theodore N. Vail, Joseph B. Thomas, Jr., Edward C. Ellis, Charles D. Barry. The general manager was C. B. Norton, secretary. Commissioners were sent to foreign countries to obtain exhibits, which were obtained from Algeria, Australasia, Austria, Belgium, Brazil, Canada, Ceylon, China, Colombia, Corea, Cuba, Denmark, Egypt, England, Fiji islands, France, Germany, Guatemala, Hawaiian islands, Holland, India, Ireland, Italy, Japan, Mexico, Morocco, Norway, Persia, Portugal, Russia, San Salvador, Scotland, Siam, Spain, Sweden, Switzerland, Turkey, and Venezuela. The exhibition was held in the building of the Massachusetts Charitable Mechanics' Association, on Huntington Avenue, in the reclaimed district, an irregular brick structure, three stories in height, built for exhibition purposes; the second and third stories formed galleries around the two main halls into which it was divided, with side-rooms for offices, restaurant, picture-gallery, etc.

The interior of the building was handsomely decorated with Persian and Indian rugs, trophies of flags, and other ornamentation. It was lighted by electric light and heated by steam, this exhibition being the first of its kind ever held in winter. On the main floors special buildings were erected by exhibitors; in the center of Washington Hall (so called) was a music pavilion, where an orchestra performed at stated times, music being also supplied by the great organ at one end of the same hall.

Of the foreign countries represented, the following sent commissioners having charge of their exhibits: Japan, Guatemala, Persia, France, Hawaii, Austria, San Salvador, Denmark, Norway, and Sweden. The number of separate exhibits was, in round numbers, 5,000, of which the largest display was from Japan, in china-ware, bronzes, ivory-carvings, and embroideries.

The Foreign Exhibition opened on September 8d, with appropriate ceremonies, including an oration by the Hon. John Jay, and closed on Jan. 12, 1884. The charge for admission to the exhibition was fifty cents, and there was no charge for space to exhibitors. Medals and diplomas were awarded. Financially, the exhibition was not successful, there being a deficit of about the amount of the original issue of stock, which was made up by subscription on the part of the stockholders.

WYOMING. Territorial Government.—The Territorial officers during the year were as follows: Governor, William Hale; Secretary, Elliot S.

N. Morgan; Treasurer, F. G. Warren; Auditor, Jesse Knight; Superintendent of Public Instruction, John Slaughter. Supreme Court: Chief-Justice, James B. Sener; Associate Justices, J. B. Blair and S. C. Parks.

Resources and General Condition.—The area of Wyoming is nearly 100,000 square miles. Its population is about 35,000, more than half of whom are in the towns on the line of the Union Pacific Railroad and its branches.

The mean elevation is 6,400 feet above the sea-level. The Rocky mountains traverse the territory from the northwest to the southeast in irregular ranges. The air is pure, light, and dry. The average rainfall is not one fourth that in the Mississippi river basin; irrigation is therefore depended upon for the raising of crops. The winters are open; there are but few snow-storms, and the strong winds which form a feature of the climate usually clear away the fallen snow in a few days.

The precious and superior metals are found widely distributed over Wyoming. The mines are, however, not far developed.

More than one fifth of the territory is covered with timber.

Cheyenne, the capital, has a population that is estimated at between 5,000 and 6,000. The stockmen of the territory make it their headquarters, and many of them have built handsome residences in the city.

Laramie City is the county town of Albany county, and the center of trade for the Laramie plains. Its population is about 4,000. The Union Pacific Railroad operates large rolling-mills in Laramie, and is now building works for the preparation of soda for the market.

Cattle.—In round numbers, the statistics of Wyoming's cattle business for 1888 may be put down thus: Stock, 800,000 head; value, \$30,000,000; shipments, 200,000 head; value, \$9,000,000 to \$10,000,000.

Sheep.—It is safe to estimate the number of sheep now in Wyoming at upward of 750,000. Next to the cattle business ranks sheep husbandry. Very little loss is sustained on account of disease. The dryness of the soil not only prevents foot-rot, but sheep affected with it when brought here are readily cured.

Horses.—Of late years many Wyoming ranch-

men have been turning their attention to horse-raising. The business can be conducted here cheaply, horses being allowed to graze all the year round. The number of horses assessed in 1888 was 26,868.

Miscellaneous Statistics.—In the following table the first column of figures represents the population of Wyoming as ascertained by the census of 1880. The second is the population of 1882, as estimated on a comparison of the vote cast at every election precinct in 1880 and 1882:

	1880.	1882.
The Territory.....	20,779	27,200
Albany county.....	4,825	6,300
Carbon county.....	3,488	4,400
Crook county.....	288	800
Laramie county.....	4,400	6,200
Johnson county.....	637	1,400
Sweetwater county.....	2,561	3,300
Utah county.....	2,879	3,400

The number of schools in 1888 was 75; pupils enrolled, 3,371. The assessed value of property the same year was \$21,566,993.50.

At the close of business on Dec. 31, 1883, on a levy of 1 mill on the dollar, the balance in the hands of the treasurer was \$49,782.68.

In 1882 Morton E. Post, Democrat, was elected delegate to Congress by a vote of 5,813 against 4,702 for his Republican opponent.

Indians.—Although there have been no hostilities with Indians for several years in Wyoming, the settlers in the northern part of the territory have been annoyed by bands of reservation Indians roaming at large over the public lands, professedly on hunting expeditions. The stockmen of northern and northeastern Wyoming have Indian reservations on three sides of their grazing country. They assert that the Indians live for protracted seasons in localities where there is little or no game, and that the losses to herd-owners, through having their cattle killed by them for food, are increasing every year, and are now so great that organized bodies of stockmen will take stringent measures to check the evil if no action is taken with that end in view by the Indian Bureau.
